FOREWORD TO DICTIONARY

The need of simple but accurate definitions of commonly used Radio and Electrical terms has existed as long as the Industries themselves. The Coyne Electrical School has made this Dictionary a part of the Coyne Electrical Trouble Shooting Manual for two very good reasons.

FIRST: A knowledge of the exact meaning of an expression or term will help a beginner, whether he be a student, an experimenter or any one else interested in the field to speed his progress and broaden his knowledge.

SECOND: The "old timer" also has need of an authoritative dictionary to serve as a reference guide on the precise meaning of many new Electrical and Radio terms. It enables him to be the authority in his plant.

This section contains over 1100 easy to understand definitions, abbreviations and terms most likely to be encountered in Radio or Electrical work. It also includes schematic symbols, tips on reading circuit diagrams and other useful information.

Whether you are a "beginner" or an "old timer" this Dictionary will be at your side whenever you need it. Get to learn the language of Electricity and Radio better by referring constantly to this section of your Trouble Shooting Manual.

We especially thank the Allied Radio Corporation, of Chicago, for their cooperation in helping us to prepare this valuable Electrical and Radio Dictionary.
A

A— (A negative or A minus.) Symbol used to designate the point in a circuit to which the negative terminal of the filament supply is to be connected.

A+. (A positive or A plus.) Symbol used to designate the point in a circuit to which the positive terminal of the filament supply is to be connected.

A BATTERY. The battery (often a single dry cell) used for supplying heating current to the filaments of radio tubes.

AB POWER PACK. A combination of batteries and devices in a single housing, used to supply potentials for receivers, especially portable sets.

A.C. Alternating current.

ACOUSTIC. Pertaining to sound.

ACOUSTIC FEEDBACK. Transfer of sound waves from a loudspeaker to any previous part, such as a microphone, in the same amplifying or broadcasting system. It can cause howling and overloading of tubes.

A.C.-D.C. RECEIVER. A receiver which will operate either from an a.c. or d.c. power source. It does not have a power transformer.

A.C. RECEIVER. A receiver designed to operate only from an a.c. power source. Power packs of these sets invariably employ a power transformer for stepping the a.c. line voltage up and down.

ACTIVE LINES. Periods during which the electron beam exists or is active in a television camera tube or picture tube, and is either scanning or else reproducing the lights and shades of the picture.

ADAPTER. Any device used for changing temporarily or permanently the terminal connections of a circuit or part.

ADJUSTABLE SPEED MOTOR. A motor whose speed may be varied gradually over a considerable range, and which then remains practically unaffected by changes in load.

ADJUSTABLE LAMPHOLDER. A lampholder having a nominal screw diameter of 1/16 inch.

ADMITTANCE. The measure of ease with which an alternating current flows in a circuit. The reciprocal of impedance. Measured in micromhos (mhos.).

AERIAL. An antenna.

A.F. Audio frequency.

AIR-CELL A BATTERY. A non-rechargeable wet-cell battery which usually is built to deliver 2 volts, for use chiefly in battery-operated home radio receivers. Its carbon electrodes are porous and absorb oxygen from the air during use. Rated life in normal radio use is 500 to 1500 hours, depending upon battery size and current drain.

AIR CORE. A term used to describe coils or transformers which have no iron in their magnetic circuits. Air-core construction is used chiefly in r.f. circuits.

AIR GAP. A path for electrical or magnetic energy through air between two objects, such as between the electrodes of a spark gap or between core sections of an iron-core transformer.

AIRPLANE DIAL. Popular name for a circular-shaped radio receiver dial with a rotating pointer, resembling the dials and pointers of airplane instruments.

ALIGING TOOL. An essentially non-metallic screwdriver or socket wrench used for adjusting the trimmer condensers and adjustable coils which are provided in radio receivers for aligning purposes or for pre-setting push-button tuners.

ALKALI-TYPE BATTERY. A storage battery using an alkaline or non-acid liquid electrolyte; an Edison battery.

ALLIGATOR CLIP. A long-nose clip with spring-controlled meshing jaws used on test leads for making quick temporary connections.

ALL-METAL TYPE TUBE. A vacuum tube having a metal envelope instead of a glass envelope. Electrode connections are made through glass beads fused into the top and bottom of the metal envelope. The octal bakelite base is designed to take eight equally spaced terminal prongs, but some of the prongs are omitted on tubes having less than eight terminals.

ALLOY. A mixture of two or more metals.

ALL-WAVE ANTENNA. A receiving antenna designed to pick up stations reasonably well over a wide range of carrier frequencies including short-wave bands as well as the broadcast band. It may be a single doublet antenna or a combination of two or more doublets.

ALL-WAVE RECEIVER. A receiver capable of receiving stations on all of the commonly used wavelengths in short-wave bands as well as the broadcast band.

ALTERNATING CURRENT. An electric current which reverses its direction of flow at regular intervals many times per second.

ALTERNATION. One-half of a cycle of alternating current, during which the current rises from zero to maximum value and returns to zero.

ALTERNATOR. A generator which produces alternating current.

A.M. Amplitude modulation. Also written as a-m or AM.

AMALGAMATE. To combine mercury with another metal, as on the surface of battery electrodes or plates.

AMATEUR. Any person who operates and experiments with short-wave transmitters as a hobby rather than for profit.

AMATEUR BANDS. Bands of frequencies assigned exclusively to radio amateurs by the Federal Communications Commission. Amateur band limits are: 1.775 to 2.000 kc., 28.000 to 30.000 kc., 3.500 to 4.000 kc., 5.600 to 30.000 kc., 7.000 to 7.300 kc., 112.000 to 116.000 kc., 14.000 to 14.000 kc., 220.000 to 230.000 kc., etc. Amateurs may also operate on any frequency above 300.000 kc.

AMATEUR OPERATOR. A person holding a valid license issued by the F.C.C. authorizing him to operate licensed amateur stations.

AMATEUR STATION. A radio station used by an amateur for personal communication with other amateurs.

AMATEUR STATION CALL LETTERS. Identifying call signals assigned to a licensed amateur operator to identify his station. Amateur calls in a given country begin with a one or two-letter prefix (W or N for U.S. and K for U.S. possessions), followed by a location-indicating numeral and two or more additional letters.

AMERICAN MORSE CODE. A dot-and-dash code which is commonly used for telegraphic communication over wires. It differs considerably from the International Morse Code which is used in radio.

AMMETER. An instrument used for measuring the current flow in amperes in a circuit.

AMP. Amperes.

AMPERE. The practical unit of electric current flow. The movement of 6,820,000,000,000,000,000,000 electrons past a given point in a circuit in one second cor-
resides to a current of one ampere. When a one ohm resistance is connected to a one volt source, one ampere will flow.

**AMPERE-HOUR.** A current of one ampere flowing for one hour. This unit is used to indicate the amount of electrical energy a storage battery can deliver before it needs recharging.

**AMPERE-TURN.** A unit of magnetizing force, equal to the number of amperes of current multiplied by the number of turns of a winding in which it flows.

**AMPLIFICATION.** The process of increasing the strength (current, voltage or power) of a signal. Amplification can be provided by transformers and tuned circuits as well as vacuum tubes.

**AMPLIFICATION FACTOR.** A vacuum tube rating indicating the theoretical maximum increase in signal strength which can be provided by a given tube.

**AMPLIFIER.** A device consisting of one or more vacuum tubes and associated parts, used to increase the strength of a signal.

**AMPLIFY.** To increase in strength.

**AMPLITUDE MODULATION.** The common system of radio broadcasting, in which the deviation in frequency above and below the assigned carrier frequency value is equal to the frequency of the sound wave being transmitted, and the amplitude of the transmitted signal varies in accordance with the instantaneous amplitude of the sound wave being transmitted. Abbreviated as a.m., or a-m or AM.

**ANALYZER.** A test instrument used for checking radio parts and circuits. It sometimes includes a special plug-in system which can be inserted in a tube socket to extend the socket terminal to the instrument for convenience in making measurements.

**NODE.** The radio tube electrode to which the main electron stream flows. The anode is also called the plate, and its use is to use a high positive potential with respect to the cathode. It is usually identified on diagrams by the letter P.

**ANT.** Antenna.

**ANTENNA.** A metallic structure or an arrangement of conducting wires or rods used for picking up or radiating radio waves. Also known as an aerial.

**ANTENNA COIL.** That coil in a radio receiver through which the antenna current flows. This coil is usually directly connected to the antenna and ground terminals inside the set.

**APPARENT POWER.** The product of volts and amperes in an alternating-current circuit whose voltage and current are not in phase, in a circuit containing inductance, capacitance or both. Measured in volt-amperes.

**APPLIANCE.** Stationary or portable power-consuming equipment such as heating devices, cooking devices, and small motor-driven equipment.

**ARMATURE.** Usually the movable portion of a magnetic circuit, such as the rotating section of a generator or motor, the pivoted iron portion of a magnetic loudspeaker, or the spring-mounted iron portion of a buzzer or relay.

**ARTIFICIAL GROUND.** A grounding electrode consisting of a metal plate, pipe or rod buried in the earth.

**ARTIFICIAL MAGNET.** A magnet made of iron or steel which has been magnetized, as distinct from a lodestone or natural magnet.

**ASPECT RATIO.** In television, a numerical ratio equal to picture width divided by picture height.

**ATMOSPHERIC INTERFERENCE.** Crackling and hissing noises reproduced in the radio loudspeaker due to electrical disturbances occurring in the atmosphere surrounding the earth; these disturbances radiate electro-magnetic waves which are picked up by antenna systems of receivers. Also called static interference, and particularly noticeable during thunderstorms.

**ATOM.** One of the elemental particles into which all matter is divided. An atom has a nucleus consisting of electrons and protons, with additional electrons revolving around the nucleus. Each of the 93 known elements has a different number and arrangement of electrons and protons in its atom.

**ATTENUATION.** Reduction in the strength of an electrical impulse.

**AUDIBLE.** Capable of being heard by the human ear.

**AUDIO AMPLIFIER.** A vacuum tube device which increases the voltage and power of an audio frequency signal. It may be a separate piece of equipment or a section in a radio receiver.

**AUDIO FREQUENCY.** A frequency corresponding to an audible sound wave. The extreme limits of audio frequencies vary with the individual and range from about 20 cycles to about 20,000 cycles per second.

**AUDIO TRANSFORMER.** An iron-core transformer used for the dual purpose of coupling together two audio amplifier circuits and changing the value of an audio signal.

**AUDIO OSCILLATOR.** An oscillator which generates audio frequency voltages.

**AUTOMATIC BASS COMPENSATION.** A special resistor and condenser circuit used in some radio receivers to make low audio frequency notes sound more natural at low volume control settings. The circuit automatically compensates for the poor response of the human ear to low-frequency sounds.

**AUTOMATIC BRIGHTNESS CONTROL.** A circuit which automatically keeps the average brightness of the reproduced image constant in a television receiver.

**AUTOMATIC FREQUENCY CONTROL.** A special radio circuit which keeps a superheterodyne receiver tuned accurately to a given station. It is found chiefly on push-button tuned receivers, where it corrects slight inaccuracies in the operation of the automatic tuning system.

**AUTOMATIC RECORD CHANGER.** An electric phonograph which automatically plays a new record when the end of the record is reached.

**AUTOMATIC TUNING.** An electrical, electro-mechanical or mechanical system which tunes a radio receiver automatically to a predetermined station when a button or lever is pushed.

**AUTOMATIC VOLUME CONTROL.** A radio circuit which automatically maintains the output value of a radio receiver constant within limits while the carrier signal picked up by the antenna is varying in amplitude over a wide range. It is used in practically all modern receivers, for it minimizes the fading of distant stations and prevents blasting when tuning suddenly from a weak station to a strong station.

**AUTOMATIC VOLUME EXPANSION.** A special audio circuit which increases the volume range of a radio program or phonograph record by making the weak passages weaker and making loud passages louder.

**A.V.C.** Automatic volume control.

**AVERAGE VALUE.** A voltage or current found by adding together a large number of instantaneous values and dividing by the number of values. In an alternation of sine wave form the average value is 0.636 times the maximum value.

**AVIATION CHANNELS.** Frequency bands assigned to aviation service for radio communication between aircraft and ground stations. These bands are both above and below broadcast band frequencies.

**B**

B— (B negative or B minus.) Symbol used to designate the point in a circuit to which the negative terminal of the plate supply is to be connected.

B+ (B positive or B plus.) Symbol used to designate the point in a circuit to which the positive terminal of the plate supply is to be connected.

**BACK EMF.** Same as counter emf.

**BACKGROUND NOISE.** Noise heard along with a received radio program, due to atmospheric interference or to circuit conditions.

**BAFFLE.** A wood, metal or composition horn or flat surface used with a loudspeaker to increase the length of the air path from the front to the back of the loudspeaker diaphragm, thereby reducing interaction between sound waves produced simultaneously by front and back surfaces of the diaphragm. A baffle thus serves to direct the sound produced by a loudspeaker.
and improve the fidelity of reproduction.

BAKELITE. A phenolic compound having high electrical resistance, used as an insulating material in the construction of radio parts such as panels, coil forms, tube sockets, etc.

BALANCED ARMATURE UNIT. An electro-magnetic sound-producing device used chiefly in magnetic loud speakers. It has a small moving iron armature which is surrounded by windings carrying audio currents. The armature is pivoted between the poles of a horseshoe magnet. Variation in the audio current cause corresponding changes in magnetism, making the armature rock back and forth. A diaphragm coupled to the armature produces sound.

BALLAST RESISTOR. A special type of resistor used in radio apparatus to compensate for fluctuations in a.c. power line voltage. It is usually connected in series with the power supply to the receiver or amplifier. The ohmic value of a ballast resistor increases automatically with increases in current through it, thereby tending to maintain essentially constant current despite variations in line voltage. BALLAST TUBE. A ballast resistor mounted in an evacuated glass or metal envelope. This construction improves the automatic voltage regulating action by reducing radiation of heat from the resistor element.

BAND. In audio, frequencies which are within two definite limits and are used for a definite purpose. Thus, the standard broadcast band extends from 550 to 1,600 kc. To B. & S. GAUGE. Brown and Sharpe wire gauge, the standard gauge used in the United States to specify wire sizes.

BAND SWITCH. A switch which simultaneously changes all tuning circuits of a radio receiver or transmitter to a different band of frequencies.

BANDSPREAD TUNING CONTROL. A small variable condenser connected in parallel with the main tuning condenser of a short-wave receiver to provide more accurate tuning.

BANTAM TUBE. A compact designed tube having a standard octal base but a considerably smaller glass envelope than does a standard glass tube. Bantam tubes are used chiefly in compact table model receivers and in battery-operated portable sets.

BANTAM JR. TUBE. An extremely small glass vacuum tube, with a special bantam jr. base, used chiefly in hearing aid units.

BASS. Low audio frequencies.

BASS CONTROL. A manually-adjusted control provided on a radio receiver for the purpose of emphasizing the loudness of the bass notes in a radio program.

BASS COMPENSATION. Any means of offsetting the natural drop in the response of the human ear to low audio frequencies at low volume levels.

BASS RESPONSE. The ability of a loudspeaker to handle low audio notes, or the sensitivity of the human ear to low audio notes.

BATTERY. One or more dry cells or storage cells connected together to serve as a d.c. voltage source.

BATTERY RECEIVER. A receiver which uses batteries as a power source.

BAYONET BASE. A type of tube and lamp base having two pronged terminals on opposite sides of the smooth cylindrical base; these engage in corresponding slots in the bayonet shell socket.

B BATTERY. A battery having many small cells, used for supplying d.c. voltages to the plate and screen grid electrodes of radio tubes used in battery-operated equipment.

BEAM POWER AMPLIFIER TUBE. A special type of vacuum tube designed for use in the output stage of a radio receiver. Deflecting electrodes concentrate the electrons into beams to give high power output along with desirable operating characteristics.

BEAT FREQUENCY. The frequency obtained when signals of two different frequencies are combined and rectified. The beat frequency is equal in numerical value to the difference between the original frequencies.

BEAT FREQUENCY OSCILLATOR. An audio frequency oscillator whose output is obtained by combining and rectifying two known higher-frequency signals which are generated by or obtained from separate circuits.

BELL WIRE. A common term for the cotton-covered B. & S. No. 18 copper wire used for making doorbell and thermostat connections in homes.

BIAS. The fixed voltage applied between the control grid and cathode electrodes of a radio tube. Also called C bias.

BIAS CELL. A tiny 1-volt or 1½-volt cell or in series to provide a negative C bias voltage for a vacuum tube amplifier circuit. It will last indefinitely if not overloaded.

BIPOLAR. Having two magnetic poles, one north and the other south. Two-pole.

BLACK LEVEL. The steady level of television carrier current or voltage while not modulated by any of the signals. The base or starting value above which the synchronizing and equalizing voltages of the television signal.

BLANKING SIGNAL. The portion of a television signal that blanks or extinguishes the electron beam in the picture tube of the receiver while the beam is being blanked in the camera tube at the transmitter.

BLASTING. Overloading of an amplifier or loudspeaker, resulting in severe distortion of loud sounds.

BLEEDER CURRENT. A current drawn continuously from a power pack to improve its voltage regulation or to increase the voltage drop value across a particular resistor.

BLEEDER RESISTOR. A resistor which is used to draw a fixed bleeder current value from a power pack.

BLOCKING CONDENSER. Any condenser used in a radio circuit to block the flow of direct current while allowing a.c. signal currents to pass.

BLOOPER. A slang term applied to a regenerative receiver which radiates a strong signal.

BODY CAPACITY. The capacity existing between the human body and a piece of radio apparatus.

BOND. A connection between metallic parts which makes them a continuous conductor in series.

BONDING. Connecting the metal housings and shields of radio parts together or to the chassis with heavy wire so they will be at the same potential (usually ground potential).

BRANCH CIRCUIT. The portion of a wiring system that extends beyond the final overcurrent device (fuse, cutout or circuit breaker) that protects the circuit. The portion of the circuit leading to lamps, appliances and other power-consuming equipment.

BREAKDOWN VOLTAGE. The voltage at which the insulation between two conductors will break down and become conductive.

BRIGHTNESS CONTROL. In a television receiver, the control which varies the amount of illumination of the reproduced image.

BROADCAST. A radio transmission intended for reception by the general public.

BROADCASTING. A general term applying to the radiation of radio waves carrying programs intended for public interest, education, or entertainment.

BROADCAST BAND. The band of frequencies between 550 kc. and 1600 kc., to which are assigned all standard broadcast stations operating in the United States.

BROADCAST STATION. A radio station used for transmitting programs to the general public.

BROAD TUNING. A condition wherein two or more stations are picked up at one time as a result of a receiver tuning dial, due to lack of selectivity in the tuning circuits.

BRUSH. A stationary conductor held in contact with a moving conductor or conductors to allow flow of current between the two and moving parts of electrical equipment.

BUCK. To oppose.

BUFFER. Any part or circuit used to reduce undesirable interaction between radio circuits.

BUFFER CONDENSER. A condenser connected between the anode and cathode of a cold-cathode rectifier tube to reduce voltage surges which might affect following parts in the apparatus.

BUFFER STAGE. An amplifier stage used to prevent feed-back of energy from a power stage to a preceding stage.

BUG. A semi-automatic code transmitting key in which movement of a lever to one side produces a series of dots, and
movement to the other side produces a single dash.

**BUILT-IN AERIAL.** An aerial which is an integral part of a radio receiver. It may be a loop aerial, a power line connection, or an arm of metal mounted in the receiver cabinet.

**BUSWAY.** A protective enclosure for buses, which are conductors formed by bars or rods of large cross section.

**BUZZER.** An electromagnetic device in which attraction of an armature by an electro-magnet interrupts the current flow; a spring then pulls the armature back, closing the circuit again so that the process repeats itself and creates a buzzing sound.

**BX.** Flexible metal conduit used to protect power line wiring in buildings and in high-tension applications.

**BY-PASS CONDENSER.** A condenser used to provide a low-impedance path for radio or audio signals around a resistor or between a circuit terminal and ground.

C

C. Letter used to designate a condenser, a grid bias voltage, or the centigrade temperature scale.

C– (C negative or C minus.) Symbol used to designate the point in a vacuum tube circuit to which the negative terminal of the grid bias source is to be connected.

C+ (C positive or C plus.) Symbol used to designate the point in a vacuum tube circuit to which the positive terminal of the grid bias source is to be connected.

**CABINET.** An enclosure for switches fuses and wire connections, designed for either surface or flush mounting and having a frame or trim on which are hung swinging doors.

**CABLE.** A stranded conductor (called a single-conductor cable) or a combination of conductors insulated from one another (called a multiple-conductor cable).

**CADMIUM.** A metal sometimes plated on a steel chassis to improve its appearance and prevent rusting.

**CALL LETTERS.** Government-assigned identifying letters for a radio station.

**CAM.** An irregular-shaped rotating or sliding part used to convert rotary motion to linear motion, or vice versa. Used extensively in mechanical push-button tuning systems.

**CANELABRA LAMPHOLDER.** A lampholder having a nominal screw diameter of 5/8 inch.

**CAPACITANCE.** Electrostatic capacity.

**CAPACITIVE REACTANCE.** The effective capacitance in opposing the flow of alternating or pulsating current.

**CAPACITOR.** Condenser.

**CAPACITOR.** A condenser or an electrostatic condenser.

**CAPACITOR MOTOR.** A split-phase motor in which a capacitor or capacitors replace part of the current in phase from the remainder in order that the motor may be self-starting on single-phase supply current.

**CAPACITY.** The electrical size of a condenser, determining the amount of electrical energy which can be stored in a condenser by a given voltage. In radio work, capacitance is measured in microfarads (μfd.) and micro-microfarads (mmμfd.); 1 μfd. is equal to 1,000,000 mmμfd.

**CAPACITIVE COUPLING.** A type of coupling in which a condenser provides a direct path for signal energy between two circuits.

**CAPACITIVE REACTANCE.** The reactance which a condenser offers to a.c. or pulsating d.c. It is measured in ohms, and decreases as frequency and capacity are increased.

**CARBON.** An element used in the construction of radio parts such as resistors, dry cells, and microphones.

**CARBON RESISTOR.** A resistor made of carbon particles and a ceramic binder molded into a cylindrical shape, with leads attached to opposite ends.

**CARBON COMPOUND.** A compound of carbon and silicon used in crystal form to rectify or detect radio waves, as in a crystal detector.

**CARRIER.** A current, voltage or radio wave having the assigned frequency of a radio station. When no sounds are being transmitted, such as during a pause between portions of a program, only the unmodulated carrier signal is present in the transmitting and receiving system.

**CARRIER FREQUENCY.** The frequency of the original unmodulated radio wave produced by a transmitter. In the case of a broadcast station, the carrier frequency must be maintained within a few cycles of the frequency value assigned to that station by the Federal Communications Commission.

**CARTRIDGE FUSE.** A fuse enclosed with an insulating and protective covering and provided with connections at both ends.

**CATHODE.** The electron-emitting electrode of a radio tube. Thermionic vacuum tubes employ heated cathodes; the heat is either supplied indirectly by a filament located inside the cathode or is supplied by current flowing through the cathode itself. In the latter case, the cathode is also the filament.

**CATHODE RAY.** A ray or beam of electrons emitted from a cathode.

**CATHODE RAY TUBE.** A special type of vacuum tube in which a beam of electrons is directed at a fluorescent screen by an electron gun, producing a brightness or white glow on the screen at the point of impact. The beam passes between electrostatic deflecting plates or electromagnetic deflecting coils which can make it bend enough to produce any desired pattern or picture on the screen when the proper varying voltages are applied to the deflecting system.

**CATHODE RAY TELEVISION TUBE.** The cathode ray tube used in television transmitting and receiving sets to reproduce the scenes being transmitted.

**CATHODE RAY TUNING INDICATOR.** A small cathode ray tube used in radio receivers to indicate when a station is tuned in accurately.

**CATHODE RAY OSCILLOSCOPE.** A test instrument using a cathode ray tube to make visible the wave form of a varying current or voltage.

**CATHODE RAY TUNING INDICATOR.** A small cathode ray tube used in radio receivers to indicate when a station is tuned in accurately.

**CATHODE RAY OSCILLOSCOPE.** A test instrument using a cathode ray tube to make visible the wave form of a varying current or voltage.

**CATWHISKER.** A small, sharply pointed wire used in crystal detector to make contact with a sensitive point on the surface of the crystal.

**C BATTERY.** The battery used for supplying a negative C bias to the control grid of a vacuum tube.

**C BIAS.** An applied voltage used to bake the control grid of a vacuum tube negative with respect to the cathode.

**CELL.** A single unit capable of serving as a d.c. voltage source. A primary cell, such as a dry cell, cannot be recharged when exhausted. A secondary cell, such as the cell of a storage battery, can be recharged when exhausted by passing a current through it in the reverse direction.

**CENTERING CONTROL.** In a television receiver, a control used to shift the entire reproduced image on the screen. The horizontal centering control moves the image horizontally in either direction, while the vertical centering control shifts the image up or down.

**CENTIGRADE.** The European scale of temperature in which 0 is the temperature of melting ice and 100 is the temperature of boiling water at sea level.

**CENTIMETER.** In the metric system of measurement, a unit equal to one-hundredth of a meter, or approximately .39 inch. There are 2.54 centimeters in one inch.

**CHAIN.** In radio, a network of radio stations connected together by special telephone lines so that all can broadcast simultaneously a program originating at a key station.

**CHANNEL.** A narrow band of frequencies including the assigned carrier frequency, within which a radio station is required to keep its modulated carrier signal in order to prevent interference with stations on adjacent channels. Also, one branch or path over which radio signals may travel; thus, a radio station may have several input channels, each with its own sound pick-up device, transmission line and volume control.

**CHARGE.** A quantity of electrical energy held on an insulated object. The electrical energy stored in a condenser. The term supplying electrical energy to a metal object is a condenser, or to a storage battery. When an object has more electrons than normal, it has a negative charge. When an object has less electrons than normal, it has a positive charge.

**CHARGER.** A device used to convert alternating current into a pulsating direct current which can be used for charging an exhausted storage battery.
CHASSIS. The metal framework on which the parts of a radio receiver or transmitter are mounted. Also used to designate the completed piece of radio equipment before it is mounted in a cabinet.

CHOKE COIL. A coil used to limit the flow of alternating current while allowing direct current to pass. R.F. choke coils have air or pulverized iron cores, while a.f. choke coils and filter chokes have iron cores.

CIRCUIT. A complete path over which an electric current can flow.

CIRCUIT BREAKER. A device for automatically opening a circuit in case of over-current in this or another circuit, and sometimes for opening the circuit in case of under-voltage.

CIRCUIT VOLTAGE. The greatest effective difference of potential between any two conductors in the circuit considered.

CLIP. A small spring-type clamp having any of several different designs, used for forming a readily removable connection to a terminal.

CLOCKWISE. The direction in which the hands of a clock move.

COAXIAL CABLE. A two-conductor cable in which one conductor is a flexible or non-flexible metal tube and the other is centrally supported inside the tube by insulators.

CM. Centimeter.

CODE. A system of dot and dash signals used in the transmission of messages by radio or wire telegraphy. The International Morse Code (also called the Continental Code) is used everywhere for radio telegraphy. The American Morse Code is used commonly for wire telegraphy.

CODE RECORDER. An instrument which makes a permanent record of code messages received by radio or otherwise.

COIL. A number of turns of wire wound on an iron core or on a coil form made of insulating material. A coil offers considerable opposition to the passage of alternating current but very little opposition to direct current.

COIL FORM. The tubing or solid object on which a coil is wound. It can have various shapes and can be made from any insulating material, such as paper, cardboard, fiber, bakelite, a plastic or ceramic materials, or wood.

COLD CATHODE. A cathode which does not depend upon heat for electron emission. The cold cathode of a photoelectric tube emits electrons when exposed to light, while in a type BH rectifier tube the electrons are pulled out of the cold cathode by a sufficiently high voltage applied to the pointed anode.

COLLECTOR RINGS. Continuous metallic rings on a rotating member, against which bear stationary brushes to allow current flow between the rotating and stationary parts of the equipment.

COLOR CODE. Any system of colors used to specify the electrical value of a radio part or identify terminals and leads.

COMMUNICATION RECEIVER. A receiver designed especially for reception of code or voice messages transmitted by short-wave radio communication services.

COMMUTATION. Conversion of alternating current generated in the armature of a direct-current machine to direct current for the external circuit.

COMMUTATOR RIPPLE. Small pulsations in the voltage and current of a direct-current generator.

COMPOUND MAGNET. A permanent magnet consisting of a number of similar magnets in close contact and with like poles together.

CONCENTRIC CABLE. Coaxial cable.

CONDENSER. A radio part consisting of two conducting surfaces separated from each other by an insulating material such as air, oil, paper, glass or mica. A condenser is capable of storing electrical energy. In radio circuits, condensers are used to block the flow of direct current while allowing alternating and pulsating currents to pass. The electrical size or capacity of a condenser is specified in microfarads and micro-microfarads.

CONDUCTIVITY. The ability of a material to carry electric current.

CONDUCTOR. Any substance in which a difference of voltage between two points causes current to flow between these points. One or more wires carrying a single current.

CONDUCTOR. A wire or other metal structure which provides a path for electrical current between two points. A conductor is thus a material which offers little opposition to the continuous flow of electric current.

CONE. The conical-shaped paper or fiber frapInvestigating the possibility of the cone of a crystal oscillator.

CRYSTAL. A piece of natural quartz or similar piezoelectric material which has been ground to a size which will vibrate naturally at a desired radio frequency and generate that frequency when subjected to a vibration. A quartz crystal is used in radio transmitters to generate with a high degree of accuracy the assigned carrier frequency of a station, and is used in crystal filters of radio receivers to improve the selectivity of the i.f. amplifier. The mineral used in a crystal detector is known as a crystal.

CRYSTAL CONTROL. Use of a quartz crystal to maintain operation of a radio station at its assigned frequency within the limits prescribed by law.

CRYSTAL DETECTOR. A detector utilizing a crystal such as silicon or gallium in contact with a pointed wire.
to rectify an incoming radio signal. Used in crystal receivers.

**TYPES OF CRYSTAL DETECTORS**

**CRYSTAL FILTER.** A highly selective tuning circuits employing a quartz crystal, sometimes used in the i.f. amplifier of a communications receiver to improve selectivity so as to permit reception of a desired station even when there is strong interference from other stations on nearby channels.

**CRYSTAL PICK-UP.** A type of phonograph pick-up in which the needle movements bend or twist a Rochelle salt crystal element and cause the crystal element to generate an audio frequency voltage corresponding to the recorded sound waves.

**CRYSTAL SET.** A radio receiver which uses a crystal detector for signal rectification, and has no vacuum tubes.

**CURRENT.** The movement of electrons through a conductor. Current is measured in amperes, in milliamperes and in micro-amperes.

**CURRENT.** Flow of electricity in conductors. The unit of current measurement is the ampere. Current is movement of free electrons along a conductor.

**CUTOUT BOX.** A surface-mounted covered enclosure for cutouts.

**CUTTING HEAD.** That part of a sound recorder which cuts or embosses on a disc, irregular grooves corresponding to the wave form of the sounds being recorded.

**C.W.** Continuous wave.

**CYCLE.** One complete reversal of an alternating current, including a rise to a maximum in one direction, a return to zero, a rise to a maximum in the other direction, and another return to zero. The number of cycles occurring in one second is the frequency of an alternating current. The word cycle is commonly interpreted to mean cycles per second, in which case it is a measure of frequency.

**CYCLE.** In an alternating current, the increases, decreases and reversals of direction which carry the current through one complete set of changes or one complete set of motions in opposite directions. A cycle consists of two alternations.

**D.** Decibel.

**D.C.** Direct current.

**D.C.C.** Distinct cotton covered insulation on wires.

**D.C. RECEIVER.** A receiver designed to operate from a d.c. power line, such as from the 110-volt d.c. lines still being used in older sections of some cities.

**D'ARSONVAL METER MOVEMENT.** The commonest movement employed in precision direct current measuring instruments. It consists essentially of a small coil of wire supported on jeweled bearings between the poles of a permanent magnet with a helical spring holding the coil and the attached indicating pointer at the zero position on the meter scale. When the current to be measured is passed through the magnetic fields of the coil and magnet interact to cause rotation of the coil and pointer.

**DEAD END.** The ends of circuit wires which are attached to supports but which are not connected to any load.

**DEAD SPOT.** A region in which signals from certain radio stations are poorly received.

**DECIBEL.** A unit used for comparing the power level of a signal to a fixed reference level of power. Also a measure of power, current or voltage gain.

**DELAYED A.V.C.** An automatic volume control circuit which does not begin to act until signals reach a certain strength. It permits reception of weak signals even though they are fading at normal a.v.c. tends to make weak signals weaker.

**DEFINITION.** In television, the clearness with which all detail in the scene are being reproduced.

**DEGENERATION.** A type of feedback which reduces signal strength. Degeneration is the opposite of regeneration.

**DEMAND FACTOR.** The ratio of the maximum demand of a system, or part of a system, to the total connected load of the system or the part of the system considered. The maximum watts actually used at any time, divided by the total wattage of all equipment connected to the system.

**DEMODULATION.** The process of rectifying or detecting a modulated radio signal in order to remove the carrier and obtain the desired audio or picture signal.

**DETECTOR.** That stage in a receiver at which the signal energy is extracted. In the detector stage of a t.r.f. receiver, the r.f. signals are separated from the desired audio signal. In the second detector of a superheterodyne receiver, the i.f. signals are separated from the desired audio signal.

**DIAL.** Any means for indicating the value to which a control knob has been adjusted. Tuning dials of broadcast band receivers indicate the frequency to which the receiver is tuned; either in kilocycles directly or in kilocycle values having one zero removed; sometimes the wavelength in meters will also be indicated.

**DIAL CABLE.** The braided cord or flexible wire cable used to make a tuning knob control the position of the pointer or dial which indicates the frequency to which a radio receiver is tuned.

**DIAL LIGHT.** The pilot lamp which illuminates the tuning dial of a radio receiver.

**DIAPHRAGM.** A thin, flexible metallic or non-metallic sheet which vibrates when struck by sound waves, as in a microphone, or which produces sound waves when moved back and forth at an audio rate, as in a headphone or loudspeaker.

**DIELECTRIC.** Any insulating material, but usually one having such exceedingly high electrical resistance as to effectively prevent flow of any current through it. A dielectric used between conductive plates in a condenser receives and retains the electric charge of the condenser. Air, mica, glass and paper are common dielectrics.

**DIELECTRIC CONSTANT.** The dielectric constant of a material is the ratio of the capacitance of a condenser using that material as its dielectric to the capacitance of a condenser otherwise similar but having air or a vacuum for the dielectric. The increase of capacitance caused by using the material instead of air for the dielectric.

**DIELECTRIC STRENGTH.** The number of volts required to break down or puncture an insulating material, and thus permit flow of current through the material.

**DIODE.** A vacuum tube having two electrodes, one being the cathode and the other the plate or anode. A diode allows electrons to pass in only one direction, from the cathode to the anode.

**DIRECT COUPLING.** The use of a conductor to connect two circuits together and provide a direct path for signal current.

**DIRECT CURRENT.** An electric current that flows always in the same direction in its circuit. The current may be steady or of constant value, or it may vary in strength, or there may be intervals of no current, but so long as current that does flow always moves in the one direction it is a direct current.

**DIRECTIONAL ANTENNA.** Any antenna which picks up or radiates signals better in one direction than another.

**DIRECTION FINDER.** A special type of radio receiver employing a highly directional loop antenna so as to permit determining the direction from which radio waves are arriving.

**DISCRIMINATOR.** In an F.M. receiver, the circuit which converts frequency modulated signal into audio signals.

**DISCRIMINATOR.** In a frequency modulated radio receiver, the tube and circuit which change the frequency modulation into variations of voltage at audio frequency, serving the same purpose as the second detector in an amplitude modulated superheterodyne receiver.

**DISTORTION.** Improper reproduction of a sound or television radio program due to changes occurring in the wave form of the intelligence signal somewhere in the path it takes through the transmitting and receiving system or through an amplifier system.

**DISTRIBUTED CAPACITY.** Capacity distributed between conducting elements such as wires, as distinguished from capacity concentrated in a conductor. Used to specify the small capacity existing between the turns of wire in a coil.

**DOUBLE-BUTTON CARBON MICROPHONE.** A carbon microphone employing two buttons or containers.
for carbon granules, one on each side of the diaphragm, so as to secure a push-pull action which gives increased signal output.

**DOUBLE-POLE.** Descriptive of a switch or other device connected in both sides of a circuit, or controlling both sides of the circuit at one time.

**DOUBLE POLE SWITCH.** A switch which simultaneously opens or closes two separate circuits or both sides of the same circuit.

**DOUBLE THROW SWITCH.** A switch which connects one circuit terminal to either of two other circuit terminals.

**DOUBLE ANTENNA.** An antenna system with an insulator inserted at its exact center, with one lead of a two-wire transmission line connected to each half of the antenna at this insulator.

**D.P.D.T.** Double pole, double throw.

**D.P.S.T.** Double pole, single throw.

**DRAIN.** A term used to indicate that current is being taken from a voltage source.

**DRIVER.** A stage of amplification used to feed or drive a final stage of amplification for the purpose of making the final stage operate at maximum efficiency.

**DROP.** The voltage drop developed across a resistor due to current flow through the resistor.

**DRY CELL.** A type of primary cell in which the electrolyte is in the form of a paste rather than a liquid. Dry cells are used extensively in radio batteries.

**DRY CELL.** A primary cell having a zinc anode, zinc and manganese dioxide anode, and a carbon cathode. It is not self-starting and is not used for radio work but is used in starting motors.

**E.** Commonly used symbol for voltage.

**EDDY CURRENTS.** Circulating currents induced in conducting materials by varying magnetic fields. They are undesirable because they represent loss of energy and cause heating. Eddy currents are kept at a minimum by employing laminated construction for the iron cores of transformers, a.f.

**EDISON BASE.** The standard screw base used for ordinary electric light bulbs in this country.

**EFFECTIVE CURRENT.** That value of alternating current which will cause the same heating effect as a given value of direct current. For sine wave alternating currents, the effective value is approximately seven-tenths of the peak value.

**EFFICIENCY.** The ratio of energy output to energy input, usually expressed as a percentage. A perfect electrical device would have an efficiency of 100%.

**ELECTRALLOY.** A soft iron alloy used for radio chassis construction.

**ELECTRICAL METALLIC TUBING.** Thin-walled light-weight steel tubing used similarly to rigid conduit for carrying and protecting insulated electrical wires.

**ELECTRICAL TRANSCRIPTION.** A direct recording of a complete program, as contrasted with a phonograph record which ordinarily contains only a single musical selection. Transcriptions are made to permit broadcasting of a particular program at any desired time by any number of stations.

**ELECTRIC EYE.** Popular expression for a cathode ray tuning indicator tube used in modern radio receiving sets. Consists of a fluorescent screen with a dark sector which varies in direct proportion with the strength of the incoming signal. Also used in connection with photoelectric cells.

**ELECTRIC FIELD.** A region in space surrounding a charged object. Lines drawn to represent the direction in which the electric field will act on other charged objects are called electric lines of force. A moving electric field, such as that associated with electrons in motion or with a radio wave, is always accompanied by a moving magnetic field.

**ELECTRICITY.** A general term used when referring to the energy associated with electrons at rest or in motion.

**ELECTRODE.** An essential part inside a vacuum tube, such as the cathode, the anode, and the grid. Also, the plates of a primary cell, secondary cell or electrolytic cell.

**ELECTRODYNAMIC LOUD-SPEAKER.** A dynamic loudspeaker in which the constant magnetic field is produced by an electromagnet. The coil of this electromagnet is known as the field coil.

**ELECTROLYTE.** The liquid or chemical paste which is used between the electrodes of a dry cell storage battery or electrolytic condenser.

---

**ELECTROLYTIC CONDENSER.** A fixed condenser in which the dielectric is a thin film of gas formed on the surface of one aluminum electrode by a liquid or paste electrolyte.

**ELECTROMAGNET.** A coil of wire, usually wound on a condenser, which produces a strong magnetic field when current is sent through the coil.

**ELECTROMOTIVE FORCE.** Voltage.

**ELECTRON.** A small active particle of negative electricity. Some electrons are closely associated with atoms of matter, while others, called free electrons, move readily between atoms under the influence of electric or magnetic fields. It is the movement of electrons through a conductor which constitutes an electric current.

**ELECTRON EMISSION.** The ejection of electrons from the surface of a material into surrounding space due to
causes. In a thermionic vacuum tube, electron emission from the cathode is produced by heat from the filament.

Electron Gun. In a cathode-ray tube or television picture tube, the cathode, the control grid and the first and second anodes; these being the parts that produce the electron beam and direct it against the fluorescent screen.

Electronic Control. The control of a machine or device by apparatus employing electron tubes.

Electronics. A broad field of electricity covering work with all types of apparatus employing electron tubes for industrial applications. Radio and television are major branches of the electronic field.

Electron Tube. Any partly-evacuated, completely-evacuated or gas-filled tube used to control the flow of electrons in a circuit. Vacuum tubes, photocells, or rectifier tubes cathode ray tubes are all electron tubes.

Electrophorus. An insulating disc and a metallic plate which, when placed together and the disc electrified by friction, produce opposite electric charges on the two elements when separated.

Electroscope. An instrument for detecting the presence of an electric charge, or for determining the polarity of electric charges.

Electrostatic Capacity. The ability to receive and retain an electric charge. The capacity of a condenser, measured in microfarads or farads. Capacitor or permittance. Symbol C.

Element. One of the ninety-three known basic forms of matter which make up the universe. The term is also used to refer to the important parts of a word. A cathode, grid and plate would be called the elements of a triode vacuum tube.

E.M.F. Electromotive force or voltage.

ENAMELED WIRE. Wire coated with an insulating layer of baked enamel.

Energy. The ability to do work, or to cause movement against an opposing force when utilized in suitable equipment. Energy exists in bodies that are in motion, in bodies such as springs that are in a strained position, in electromotive force, in chemicals, and in heat. Energy existing in one form may be changed to energy existing in other forms; as when chemical energy in a battery changes to electromotive force.

Envelope. The glass or metal housing of a radio tube.

Equalizing Signal. The portion of a television signal that insures that the two fields making up one frame start at the correct positions on the picture area of the picture tube at the receiver.

Escutcheon. The ornamental wood, metal or plastic framework for a radio dial, tuning indicator or other panel-mounted part in a radio receiver or amplifier.

Ether. The medium which is supposed to fill all space, and through which radio, heat, and light waves are supposed to travel. Its existence has not yet been definitely proved.

Exciter. A small generator for supplying high-frequency current to the field windings of an alternator. Sometimes refers to an oscillator.

Explosion-Proof. Enclosed in a case which is capable of withstanding an explosion of a specified gas or vapor with the prevention of the ignition by sparks, flashes or explosions of that gas or vapor surrounding the enclosure.

F.

F. Frequency.

Fahrenheit. Scale of temperature.

Facsimile. A system of radio communication in which photographs, handwriting, and printed matter of any kind are transmitted to receivers which feed into facsimile recorders.

Facsimile Recorder. An instrument which reproduces on paper the illusion, with printed matter being transmitted by a facsimile system.

Fading. An essentially regular rise and fall due to variations in transmission conditions along the path taken by the radio wave from the transmitting antenna to the receiver.

Fahrenheit Temperature. The temperature-measuring system generally used in the United States, in which 32 degrees is the temperature of melting ice and 212 degrees is the temperature of boiling water at sea level.

Farad. The basic unit of capacity, but too large for practical use. The microfarad, equal to one millionth of a farad, is a more practical unit for radio work. An even smaller unit, the micro-microfarad, is also used in radio; it is equal to one millionth of a microfarad.

F.C.C. Federal Communications Commission. A commission appointed by the President of the United States and given licensing and regulating authority on matters dealing with wire and radio communication in the United States; and its possessions.

Feedback. Transfer of energy from one point in an electrical system to a preceding point, such as from the output back to the input.

Feeder. Any conductors of a wiring system between the service equipment, or other switchboard of an isolated plant, and the overcurrent devices that protect branch circuits.

Fidelity. The faithfulness with which part or all of an electrical system delivers an exact reproduction of the input signal waveform.

Field. The effect produced in surrounding space by an electrically charged object, by electrons in motion, or by a magnet.

Field. 1. Magnetic or electromagnetic field; the space in which appear the magnetic lines of force around a magnet or an electromagnet. 2. Electrostatic field; the space between two opposite electric charges, in which appearance electric or magnetic lines of force exist.

Field Coil. In an electrodynamic loudspeaker, the coil which produces the constant-strength magnetic field.

Field Frequency. In television systems employing interlaced scanning, this term refers to the number of times per second the frame area is fractionally scanned.

Field Magnet. The permanent magnet or electromagnet which supplies a magnetic field in a generator, motor or other electrical equipment.

Filament. The resistance wire through which filament current is sent in a vacuum tube to produce the heat required for electron emission. When electron emission is from the surface of the filament wire itself, the filament is also serving as the cathode. When the filament merely supplies heat to a separate cathode-type or indirectly-heated tube.

Filament Circuit. The complete circuit over which filament current flows from the A battery, filament winding or other filament voltage source to the filaments of radio tubes and pilot lamps.

Filament Current. The current supplied to the filament of a vacuum tube for heating purposes.

Filament Voltage. The voltage value which must be applied to the filament winding of a vacuum tube in order to provide the rated value of filament current.

Filament Winding. A separate secondary winding provided on the power transformer of a radio receiver or other a.c.-operated apparatus for use as a filament voltage source.

Filter. A resistor, coil, condenser or any combination of these parts which is used to block or attenuate alternating voltages or currents with frequencies which will allow essentially unimpeded flow of currents at other frequencies or of direct current. Thus, the filter in a radio power pack is a coil, condenser and resistor, and receives a pulsating direct current having many a.c. components, but delivers an essentially pure and constant direct current.

Filter Choke. A coil used in a filter system to pass low frequency currents or direct current while limiting or blocking the flow of higher-frequency alternating or pulsating currents.

Filter Condenser. A condenser used in a filter system to permit passage of higher-frequency currents while limiting or blocking the flow of lower-frequency currents and direct current.

First Audio Stage. The first stage in a radio receiver. Audio signals are fed into this stage by the detector of a t.r.f. receiver, and by the second detector of a superheterodyne receiver.

First Detector. The stage in a superheterodyne receiver in which the incoming modulated r.f. signal and the r.f. signal from the local oscillator are combined to produce the i.f. signal.
FITTING. A part such as a bushing or locknut which is intended to perform some mechanical function, rather than electrical, in a wiring system.

FIXED CONDENSER. A condenser having a definite capacity value which cannot be adjusted.

FIXED RESISTOR. A resistor having a definite ohmic value which cannot be adjusted.

FLEXIBLE METAL CONDUIT. A hollow tube formed by spirally wound metallic strips, within which are placed insulated electric wires for protection and support.

FLUORESCENT LAMP. A form of lamp which emits visible light when fluorescent material (phosphors) on the inside of the lamp tube are struck by streams of electrons passing between electrodes in the ends of the tube.

FLUORESCENT SCREEN. A coating of chemical material which glows when bombarded by electrons. In a cathode ray tube, the coating is on the inside surface of the evacuated glass envelope of the tube.

FLUX. The magnetic lines of force in a magnet or in a magnet and its magnetic field. In a magnet, it is similar to the current in electric circuits, since both terms refer to a flow.

FLYBACK PERIOD. A period or interval during which the scanning beam in the television camera is extinguished or is blanked while the controls which move the beam return to the conditions at which the previous trace is to be made over the picture image.

F.M. Frequency modulation. Also written as F.M. or FM.

FOCUSING CONTROL. In a cathode ray oscilloscope or television system, the control which adjusts the size of the visible spot produced at the screen by the electron gun in a cathode ray tube.

FOUR-WAY SWITCH. A switch used in a circuit that permits a single lamp to be controlled from any of three or more positions. The switch has four terminals which alternately are joined together in different pairs.

FRAME. In television, one complete scanning of every part of the field of view being transmitted.

FRAME. One complete scanning of the image in the television camera tube. One frame consists of two fields.

FRAME FREQUENCY. In television, the number of complete cycles per second which the entire frame area is scanned.

FRAMING CONTROL. In television, a general term applying to any of the control knobs used for adjusting the centering, width and height of the reproduced image.

FREE ELECTRONS. Those electrons which are free to move between the atoms of a material when acted upon by electric or magnetic forces.

FREQUENCY. The number of complete cycles per second which an electric current or a vibrating object undergoes. Frequency in cycles is equal to the velocity divided by the wavelength.

FREQUENCY CONVERTER. A circuit or device which changes the frequency of an alternating current. Typically, the oscillator and mixer-first detector stages make up the frequency converter of a superheterodyne receiver.

FREQUENCY DISTORTION. A type of distortion which occurs when a circuit or device amplifies or transmits unequal the different frequencies it is handling.

FREQUENCY MODULATION. A relatively new form of radio broadcasting perfected by Major E. H. Armstrong, in which the amount of deviation from the frequency below which the tube is operated distorts the sound wave being transmitted, and the number of complete deviations per second above and below the resting frequency is equal to the frequency of the sound wave being transmitted.

Advantages of this system include almost complete freedom from atmospheric and man-made interference, as well as little or no interference between stations, thereby permitting the transmission of a much greater volume range and a wider audio frequency range than is possible with amplitude modulation. The disadvantage is the necessity of employing ultra-high carrier frequencies, at which the range of a station is limited to approximately 100 miles.

FREQUENCY RESPONSE. A rating or graph which expresses the manner in which a circuit or device handles the different frequencies falling within its operating range. Thus, the frequency response of a loudspeaker may be specified in terms of uniformity between 100 and 6000 cycles.

FULL-WAVE RECTIFIER. A radio tube or other device which rectifies an alternating current in such a way that both halves of each input a.c. cycle appear in the output. A full-wave rectifier tube contains two separate diode sections, one passing current during one alternation, and the other passing current during the opposite half cycle.

FUSE. A strip or wire of metal which, when it carries an electric current greater than the capacity or rating of the fuse, will become so heated by the excess of current as to melt or burn out. The fuse is connected in the circuit to be protected against overcurrent, and melts to open the circuit when overcurrent exists in the circuit. A fuse sometimes is called a cutoff. Other terms include automatic relays and circuit breakers.

GAIN. In an amplifier stage or system, the ratio of output voltage, current or power to input voltage, current or power. Usually expressed in decibels.

GALENO. Lead sulphide, a shiny bluish gray mineral often used as the crystal in crystal detectors.

GANG SWITCH. Two or more rotary switches mounted on the same shaft and operated by a single control.

GANG TUNING CONDENSER. Two or more variable tuning condensers mounted on the same shaft and operated by a single control.

GASEOUS TUBE. An electronic tube into which a small amount of gas or vapor is admitted after the tube has been evacuated. Ionization of the gas molecules during operation of the tube gives greatly increased current flow.

GAS-FILLED LAMP. An incandescent lamp whose bulb is filled with nitrogen and neon gases to permit operating the filament at higher temperatures than in vacuum lamps.

GENERATOR. A rotating machine which converts mechanical energy into electrical energy. Also, a radio device or circuit which develops an a.c. voltage at a desired frequency when energized with d.c. or low frequency a.c. power.

GETTER. An alkali metal introduced into a vacuum tube during manufacture and subsequently, after the tube has been evacuated, to absorb any gases which may have been left by the vacuum pump. The silver deposit on the inside of the glass envelope of a tube, usually near the tube base, is the result of getter vaporization.

GHOST IMAGE. In television, an undesired duplicate image appearing a fraction of an inch to one side of the desired image, due to reception of a reflected signal along with the signal coming directly from the television station. The remedy involves using a directional receiving antenna adjusted so it will receive signals coming over only one path.

GLASS-TYPE TUBE. A vacuum tube or gaseous tube having a glass envelope or housing.

GLOW LAMP. A gaseous tube having a glass envelope through which can be seen a glow such as due to ionization of the molecules of gas. Neon gas gives a red glow, mercury vapor gives blue, and argon gas gives a light blue glow. Also called glow tube.

GRAM. The unit of weight in the metric system. One pound equal to 453 grams.

GRID. An electrode mounted between the cathode and the anode of a radio or electron tube to control the flow of electrons from cathode to anode. The grid electrode is usually either a cylindrical-shaped wire screen or a spiral of wire through which electrons can readily move.

GRID BIAS. Another term for C bias, which is the voltage used to make the control grid of a radio tube negative with respect to the cathode.

GRIP CLIP. A spring clip used to make an easily removable connection to the cap terminal located at the top of some radio tubes.

GRID CONDENSER. A small fixed condenser inserted in the grid circuit of a vacuum tube.
GRID LEAK. A resistor of high ohmic value, used to connect the control grid to the cathode in a grid leak-condenser detector circuit.

GRID-LEAK-CONDENSER DETECTOR. A type of detector in which all potentials developed across a grid resistor by the flow of grid current that result in plate current changes at the desired audio frequency. This type of detector is identified by the presence of a grid leak and grid condenser in the grid circuit.

GRID RETURN. The lead or connection which provides a path for electrons from the grid circuit or B bias battery to the cathode.

GRILLE. An arrangement of wood or metal bars placed across the front of the loudspeaker in a radio receiver for protective purposes and to enhance the design of the cabinet.

GRILLE CLOTH. A loosely woven cloth stretched behind the loudspeaker grille of a radio receiver to keep dust and other foreign matter out of the loudspeaker diaphragm. Sound waves travel undisturbed through this cloth.

GROMMET. A special washer, made of rubber or other insulating material, used to prevent a wire from touching the sides of a chassis hole through which the wire is run.

GROUND CLAMP. A metal strap or clamp used for making a good electrical connection to a ground rod or grounded pipe. The clamp has a screw terminal or soldering lug to which the ground wire of a radio receiver can readily be attached.

GROUND WIRE. The wire used to connect the ground terminal of a radio receiver or transmitter to a ground clamp or other grounded object.

GROUND WAVES. Radio waves which travel along the surface of the earth instead of going up into the sky.

GROUNDING CONDUCTOR. A wire or other conductor used to connect electrical equipment or one of the conductors in a wiring system with ground or other grounded conductor buried in the earth.

GUTTER. A trough or recess for wire leads and wire splices in a cabinet or box.

GUY WIRE. A wire used to brace the mast or tower of a transmitting or receiving antenna system.

HALF-WAVE RECTIFIER. A radio tube or other device which converts alternating current into pulsating direct current by allowing current to pass only during one half of each alternating current cycle. A half-wave rectifier tube contains only one diode section.

HARMONIC. A multiple of any particular frequency. Thus, the second harmonic of a fundamental frequency would be built up in two times that fundamental frequency.

HARMONIC DISTORTION. Another name for wave form distortion.

HARTLEY OSCILLATOR. A vacuum tube oscillator circuit identified by a tuned circuit which employs a tapped winding connected between the grid and plate of the vacuum tube, with the tap going to the cathode.

HAZARDIOUS LOCATIONS. Locations in which special types of electrical equipment and devices are required to insure safety. Places where flammable materials are stored other than in original containers, where dust may become combustible or explosive, where dust and hydrogen sulfide combine to cause overheating, and where combustible materials are handled, manufactured, stored, or used.

HAZELTINE LICENSED. Radio apparatus which uses Hazeltine patents under a licensing agreement with the Hazeltine Corporation.

HEADPHONE. A small telephone receiver, held against an ear by a clamp passing over the head, used for private reception of radio programs or for reception of signals which are too weak to provide loudspeaker volume. Headphones are usually used in pairs, one for each ear, with the clamping strap holding them both in position.

HEATER. A filament used in a vacuum tube only for the purpose of supplying heat to the cathode, and an insulated cathode and filament in such a manner that the filament is heated and the cathode is cooled by the movement of electrons.

HEAVISIDE LAYER. A layer of ionized gas which scientists believe exists in the region between 50 and 400 miles above the surface of the earth, and which causes radio waves to bend back to earth under certain conditions. Also called the Kennelly-Heaviside layer.

HELIX. A coil formed by a single-layer spiral winding, usually with no iron in the core space.

HENRY. The practical unit of inductance.

HIGH-FIDELITY RECEIVER. A receiver capable of reproducing audio frequencies in a range from 50 to about 8,000 cycles or wider without serious distortion. A receiver which approaches the goal where the reproduced program cannot be distinguished from the original studio program.

HIGH-FREQUENCY TRIMMER. In a superheterodyne receiver, the trimmer condenser which controls the calibrations of a tuning circuit at the high-frequency end of a tuning range.

HOLD CONTROLS. In a television receiver, the two manually-adjusted controls which adjust the natural oscillating frequencies of the oscillators employed in the horizontal and vertical sweep circuits.

HOLDING-UP. A diagram giving circuit connections for a radio receiver, amplifier or transmitter.

HORIZONTAL OSCILLATOR. In a television receiver, the oscillator that uses the horizontal synchronizing and blanking signals to produce voltages which, when amplified, operate the deflecting plates or coils in the picture tube.

HOT-CATHODE TUBE. A vacuum or gaseous tube in which the cathode is heated by electron emission.

HOT WIRE METER. A mass flow measuring instrument in which a wire whose pointer is allowed to move across the dial when a wire inside the meter is heated and expanded by the measured current flowing through the wire.
INCANDESCENT LAMP. An electric lamp in which light is produced by the white-hot temperature of the filament in which heat is produced by current flowing against the resistance of the filament.

INDOOR ANTENNA. A receiving antenna system located entirely inside a building, either under a rug, around the walls, or in the attic.

INDUCED VOLTAGE. A voltage produced in a conductor as the result of the change in the magnetic lines of force which are linking or cutting through the conductors of the circuit.

INDUCTANCE. That property of a coil or other part which tends to prevent any change in current flow. Inductance is effective only when varying or alternating currents are present; it has no effect whatsoever upon the flow of direct current. Inductance is measured in henrys.

INDUCTION. Electromagnetic induction is the production of an emf or voltage in a conductor which moves through a magnetic field and cuts across the lines of force, or when the magnetic flux is changed across the conductor. Magnetic induction is the production of magnetism in a piece of iron or steel by magnetic lines of force from another magnet.

INDUCTIVE MOTOR. An alternating-current motor in which energy from stationary windings is transferred to conductors on the revolving rotor by electromagnetic induction, and in which the current flow is increased through any conductive connections such as brushes and a commutator or slip rings.

INDUCTIVE COUPLING. A form of coupling in which energy is transferred from a coil in one circuit to a coil in another circuit by induction. Magnetic lines of force produced by the flow of current through one coil cause an a.c. voltage to be induced in the other coil.

INDUCTIVE REACTANCE. Reactance due to the inductive effect of a coil or other part in an alternating current circuit. Inductive reactance is measured in ohms, and is equal to the inductance in henrys multiplied by the frequency in cycles, times the number 628; inductive reactance therefore increase with frequency.

INSTANTANEOUS VALUE. The voltage, current, or other value at some instant of time in a circuit wherein the voltage or current is continually changing, as with alternating current.

INSTRUMENT TRANSFORMER. A current transformer, which see.

INSULATION. Any material which has a sufficiently high electrical resistance to permit of the safe transmission of electrical current, part or wire from others. Cotton, silk, baked enamel, mica, porcelain, rubber and bakelite are a few of the common insulating materials used in the number 628; insulating reactance therefore increase with frequency.

INSULATOR. A part made of insulation in a form suitable for supporting electrical conductors or for separating them electrically from other conductors.

INTELLIGENCE SIGNAL. Any signal which conveys information, such as voice, music, code, television pictures, facsimile photographs, diagrams, written and printed matter, etc.
Radio Dictionary

tricity through a resistance of one ohm for one second.

JUMPER. A wire used to connect two points together temporarily.

K.

K. Letter used to designate the cathode of a radio tube.

KC. Kilocycle.

KENNELLY-HEAVISIDE LAYER. A layer of ionized gas supposed to exist in the region between 50 and 400 miles above the surface of the earth. It reflects radio waves back to earth under certain conditions, making possible long-distance reception.

KEY. A lever-type switch designed for rapid opening and closing of a circuit during transmission of code signals.

KILOCYCLE. One thousand cycles but commonly interpreted as 1,000 cycles per second.

KILOWATT. One thousand watts.

KINESCOPE. A cathode ray tube developed by the Radio Corporation of America and used in television receivers for the purpose of reproducing on a screen the scene originally televised.

KIRCHOFF'S CURRENT LAW. A fundamental electrical law which states that the sum of all the currents flowing to a point in a circuit must be equal to the sum of all the currents flowing away from that point.

KIRCHOFF'S VOLTAGE LAW. A fundamental electrical law which states that the sum of all the voltage sources acting in a complete circuit must be equal to the sum of all the voltage drops in that same circuit.

KNIFE SWITCH. A switch in which one or more flat metal blades, each pivoted at one end, serve as the moving parts. The blades are usually of copper; when the switch is closed, they make contact with flat gripping spring clips and complete the circuit.

KNOW THE TYPES OF RADIO KNOBS

KNOB. A radio part, usually round but sometimes having a pointer or other position-indicating means, which is attached to the end of a control shaft to make it easier to rotate the shaft with the fingers.

KW. Kilowatt.

L.

L. The letter commonly used on circuit diagrams and in formulas to designate an inductance or coil.

LAMINATED. A type of construction widely used for the cores of iron core transformers, choke coils, electromagnets, motors and generators. It involves building up the desired shape of core with thin strips of a magnetic material such as soft iron or silicon steel.

LAMPHOLDER. A screw shell device for receiving the screw base of an incandescent lamp bulb or other part with a similar screw base, and for making electrical connections to the part thus held. Often called a lamp socket.

LAPEL MICROPHONE. A small microphone which can be attached to a lapel or pocket by means of a clip.

LAYOUT. A diagram indicating the placement of parts on a panel or chassis.

LEAD-ACID BATTERY. A storage battery in which the plates for the cells have active materials of sponge lead and lead peroxide, and in which the electrolyte liquid is a mixture of sulphuric acid and water. The most common type of storage battery.

LEAD-IN. A wire which serves to connect the outdoor signal pickup portion of an antenna system with the antenna terminal of a radio receiver.

LEAD-IN INSULATOR. A porcelain tube inserted in a hole drilled through an inner wall or window frame of a house. The lead-in wire of the antenna is run through this tube.

LEAKAGE. Undesirable flow of current through or over the surface of an insulating material. This term is also used to describe magnetic flux which wanders off into space without doing useful work.

LEAKAGE FLUX. That portion of the total magnetic flux which does not link all of the turns of wire in a coil or transformer and is consequently wasted.

LEAKAGE RESISTANCE. The resistance of a path taken by leakage currents. Thus, the leakage resistance of a condenser is the normally high resistance which it offers to the flow of this current.

LEYDEN JAR. A form of condenser consisting of a glass jar which acts as the dielectric, coated inside and outside with tin foil which acts as the conductive plates.

LIGHTING OUTLET. In a building wiring system an outlet intended for direct connection of a lampholder, a lighting fixture, or a cord that carries a lampholder.

LIGHTNING ARRESTER. A protective device used to sidetrack directly to ground a discharge of lightning which strikes a radio receiving or transmitting antenna.

LIMITER. In a frequency modulation radio receiver, a tube circuit which eliminates any amplitude modulation which may have affected the carrier wave and leaves only the frequency modulation.

LINE CORD. A two-wire cable terminating in a two-prong plug, used to connect a radio receiver to an a.c. or d.c. outlet. Sometimes this cord also includes a resistance wire used for the purpose of reducing the line voltage to the value required by the series-connected filaments of the tubes.

LINE FILTER. A device inserted between the line cord plug of a radio receiver and the power line to block noise signals which might otherwise enter from the power line. It contains one or more choke coils and condensers.

LINE OF FORCE. A path through space between magnetic poles or electrostatic poles, along which acts the magnetic or electrostatic force as shown by lines drawn between the poles on a sketch.

LINE VOLTAGE. The voltage existing at a wall outlet or other terminals of a power line system. In the United States, the line voltage is usually between 115 and 120 volts, but may vary at times as much as five volts above and below these limits.

LOAD. Lamps, motors, heaters, or any other energy-consuming or power-consumption equipment connected to a battery, generator or a circuit supplying power and energy. The load might be measured in watts, watt-hours, ohms, milliamperes, volts, or any other unit which would indicate the size or magnitude of the load.

LOG. A list of radio stations. A record of stations with which a radio transmitter has been in communication; a record of radio operators required by law to keep this log. A detailed record describing the program being broadcast each minute of the operating day by a broadcast station. A record of operators who are required by law to be taken at regular intervals in a broadcast transmitter and in certain other types of transmitters.

LOGGING. Making a record of the exact dial settings at which a radio station is received, or making a written record of any other essential data in connection with radio equipment.

LOKTALE. A small-size glass radio tube having a special base, consisting of a tube firmly in the corresponding special 8-prong loktal socket. Loktal tubes are used chiefly in midget a.c.-d.c. receivers and in auto radios.

LONG WAVES. Wave lengths longer than the longest broadcast band wave length of 545 meters. Long waves correspond to frequencies between about 20 kilocycles and 550 kilocycles.

LOOP ANTENNA. An antenna consisting of one or more complete turns of wire. It may be built into a radio receiver cabinet or separately mounted, and is usually tuned to resonance by a variable condenser. Loop antennas are used extensively in radio direction-finding apparatus.

LOSS. Energy which is dissipated before it accomplishes useful work.

LOUDSPEAKER. A device for converting audio frequency signals into sound waves.

LOUVER. A type of loudspeaker grille construction in which sloping slats or equivalent parts of a molded plastic cabinet hide the loudspeaker yet allow sound waves to emerge unhindered. Also used to describe the fins on a radiator.

LOW-FREQUENCY PADDERS. In a superhetodyne receiver, a semi-adjustable condenser which is placed in series with the oscillator tuning circuit.
to control the calibration of the circuit at the low-frequency end of the tuning range.

LOW-LOSS CONSTRUCTION. A type of radio part construction involving the use of insulating materials which maintain their insulating characteristics at high radio frequencies.

LUG. A small strip of metal placed on a terminal screw or riveted to an insulating material to provide a convenient means for making a soldered wire connection.

M. A letter sometimes used to indicate that a particular resistance value is to be multiplied by 1,000. Thus, 50M would mean 50,000 ohms.

MA. Milliamphere.

MAGNET. A piece of iron or steel which has the property of attracting other pieces of magnetic material such as iron, and has the property of attracting or repelling other magnets.

MAGNET WIRE. Insulated copper wire in sizes commonly used for winding coils used in electro-magnetic devices such as transformers, choke coils and relays.

MAGNETIC CIRCUIT. A complete path for magnetic lines of force. It always includes the permanent magnet or electromagnet which is producing the magnetic lines of force.

MAGNETIC FIELD. A region in space surrounding a magnet or a conductor through which current is flowing.

MAGNETIC INDUCTION. The magnetizing of iron or steel by the magnetic field of a magnet which is near to or in contact with the magnetized metal.

MAGNETIC LINES OF FORCE. Imaginary lines used for convenience to designate the directions in which magnetic forces are acting throughout the magnetic field associated with a permanent magnet, electromagnet or current-carrying conductor.

MAGNETIC LOUD-SPEAKER. A loudspeaker consisting essentially of a permanent magnet, a pivoted armature which is mechanically connected to the diaphragm or cone, and a coil which is connected to the output stage of a radio receiver or other apparatus. Interaction between the permanent magnetic field and the current in the armature by the coil results in movement of the armature and production of sound waves by the diaphragm.

MAGNETIC PICK-UP. A phonograph pick-up consisting of a permanent magnet, one or more iron wires, and a core structure so arranged that movement of the phonograph needle in the record groove varies the amount of magnetic flux passing through the coils, thereby inducing audio frequency voltages in the coils.

MAGNETIC FLUX. Total number of magnetic lines of force acting in a magnetic circuit.

MAGNETIC POLARITY. Identification of magnetic poles according to the direction of lines of force; the north pole being the one at which lines issue from the magnet, and the south pole the one at which they re-enter the magnet.

MAN-MADE STATIC. High-frequency noise signals which are produced by sparking in electrical apparatus or power lines and picked up by radio receivers, with the result that buzzing and crashing sounds are heard along with a desired radio program.

MANUAL TUNING. Tuning a radio receiver to a desired station by rotating the tuning control knob by hand.

MASTER SERVICE. Service conductors and equipment for a group of buildings under one management.

MATCHING. Connecting two circuits or parts together with a coupling device in such a way that the impedance of either circuit will be equal to the impedance existing between the coupling terminals to which that circuit is connected.

MAXIMUM UNDISTORTED OUTPUT. The maximum audio power output which a radio receiver or audio amplifier will deliver without having more than 10% harmonic distortion. Tests have shown that this amount of distortion is not ordinarily noticeable or objectionable.

MAXIMUM VALUE. The greatest value reached by an alternating voltage or current during any instant in the cycle.

MAYDAY. The international distress call for radiotelephone communication. It is derived from the French pronunciation of "Maiden," meaning "Help me."

MC. Megacycle.

MEDIUM LAMPHOLDER. A lampholder having a nominal screw diameter of one inch.

MEG. Megohm.

MEGACYCLE. One million cycles per second.

MEGOHM. A resistance of one million ohms.

MERCURY. A heavy, silver-colored metal which is liquid at ordinary room temperatures. When heated, it gives off a vapor which is highly conductive when ionized.

MERCURY VAPOR LAMP. A lamp in which a small quantity of mercury is vaporized by the heat of an electric discharge through argon gas, after which flow of current through the mercury vapor produces light.

MERCURY VAPOR RECTIFIER TUBE. A rectifier tube containing a small amount of mercury. When the filament or heater-type cathode is heated, mercury vapor is produced, and the resulting ionization of the mercury vapor molecules gives a much higher plate current than would be obtained in an equivalent vacuum type rectifier tube.

METALLIZED RESISTOR. A resistor made by depositing a thin film of high-resistance metal on the surface of a tube or rod made of glass or other insulating material. Leads are attached to opposite ends of the unit.

METAL-TYPE TUBE. A vacuum or gaseous tube having a metallic envelope or housing, with electrode connections being made through glass beads fused into the metal envelope. Usually called all-metal tube.

METER. The unit of length in the metric system; one meter is equal to 3.28 feet. An instrument used for making electrical measurements. A volt- meter measures voltage; an ammeter or milliammeter measures currents; a wattmeter measures power; an ohmmeter measures resistance.

MF. Microfarad.

MH. Millihenry.

MICA. A transparent, vitreous mineral which splits readily into thin sheets and has excellent insulating and heat-resisting qualities. It is used extensively to separate the plates of condensers, to insulate electrode elements of vacuum tubes, and for many other insulating purposes in radio apparatus.

MICA CONDENSER. A condenser which employs sheets of mica as the dielectric material which insulates adjacent plates from each other.

MICRO. A prefix meaning one million.

MICROAMPERE. One millionth of an ampere.

MICROFARAD. A unit of capacity equal to one millionth of a farad. The microfarad is the capacity unit most commonly used in radio work. It is abbreviated as μf.

MICRO-MICROFARAD. A unit of capacity equal to one millimicrofarad, and abbreviated as μμf.

MICROPHONE. A device which converts sound waves into corresponding audio frequency electrical energy. It contains some form of flexible diaphragm which moves in accordance with sound wave variations. This movement, in turn, generates a minute voltage which is fed to the input of an amplifier which is amplified many times. There are several types of microphones available, but all depend on the above principle. Carbon Microphone. A microphone in which loosely packed carbon granules com-
complete the electrical circuit between two terminals. The resistance of this circuit varies in accordance with variations in the pressure exerted on the diaphragm. In a single-button carbon microphone, the granules are on only one side of the diaphragm. In a double-button carbon microphone, the granules are on both sides of the diaphragm, giving a push-pull action which greatly increases the resistance change produced by a given diaphragm movement. Condenser Microphone. A microphone in which the diaphragm serves as one plate of a condenser. Sound waves move the diaphragm, causing the plates of the condenser to develop an electrostatic potential which is varied in accordance with the amplitude of the sound waves. This is the principle underlying all condenser microphones. Contact Microphone. A microphone designed to pick up mechanical vibrations directly and convert them into electrical impulses. It is used chiefly with string, wind, and percussion musical instruments, and is simply strapped or clamped to the instrument. Dynamic Microphone. A microphone in which the diaphragm moves a voice coil back and forth in a constant magnetic field, causing audio currents to be induced in the coil. A small dynamic loudspeaker is often made to serve as a dynamic microphone, particularly in two-way intercommunication systems. Velocity or Ribbon Microphone. A microphone in which a thin, lightweight ribbon of duralumin alloy serves as the diaphragm. This ribbon is mounted in a powerful fixed magnetic field. Audio frequency voltages are induced in the ribbon when it is moved back and forth through the magnetic field by sound waves.

Microphone Pre-Amplifier. An audio amplifier which amplifies the output of a microphone sufficiently so that the audio signal may be heard over a transmission line to the main amplifier. Sometimes, particularly with condenser microphones, this microphone amplifier is mounted right on the microphone stand or in the microphone housing itself.

Microphone Button. A button-shaped container filled with carbon particles. When attached to the diaphragm of a microphone, the resistance between the terminals of the button varies in accordance with movements of the diaphragm.

Microphone Stand. A table or floor-type stand used to support a microphone in a desired position.

Microphone Transformer. The iron-core a.f. transformer which couples the microphone to a microphone amplifier, to a transmission line, or to the input circuit of the main audio amplifier.

Microphonic. A condition in which mechanical movement of some radio part other than a microphone causes corresponding variations in circuit current. A radio tube is microphonic if a pingling sound is heard in the loudspeaker when the tube is tapped with a finger; the tapping is then setting the internal elements into vibration. If sound waves from the loudspeaker are producing this vibration of the tube elements, the sound will be sustained as a howl.

Mike. A microphone.

Mili. A prefix meaning one thousandth.

Milliammeter. A measuring instrument which measures current flow in milliamperes.

Milliamperes. An electric current of 1/1000 of an ampere.

Millihenry. A unit of inductance equal to one-thousandth of a henry.

Millimeter. A metric unit of length equal to one thousandth of a meter. One millimeter is approximately equal to one twenty-fifth of an inch.

Millivolt. A unit of voltage equal to one thousandth of a volt.

Mixer. A control which permits combining the output signals of two or more microphones or other a.f. signal sources in any desired proportion before these signals are fed to the input of the main a.f. amplifier. Also, the stage in a superhet or sync receiver in which the incoming modulated r.f. signals are mixed with the local oscillator signals to produce the i.f. signal.

Mm. Millimeter.

Mobile Station. A radio station operated in a movable location such as on an automobile, fire truck, railroad train, ship or airplane.

Modulated Amplifier. The r.f. stage in a transmitter at which the intelligence signal is made to modulate the r.f. carrier signal.

Modulated Wave. A radio wave which varies either in frequency (frequency modulation) or in amplitude (amplitude modulation) in accordance with the wave form of the intelligence signal being transmitted.

Modulation. The process of varying the frequency or the amplitude of an r.f. carrier signal in accordance with the wave form of the intelligence signal being transmitted.

Modulator. The final audio stage in a radio transmitter. It feeds the intelligence signal into the modulated amplifier stage, where the signal is made to modulate the r.f. carrier carrier signal.

Mogul Lampholder. A lampholder having a nominal screw diameter of 1/2 inches.

Molecule. The group of atoms which constitutes the smallest particle in which a compound or material can exist separately.

Monkey Chatter. Garbled speech or music heard along with a desired program. This type of interference occurs when the frequencies of an adjacent-channel station beat with the desired station signal.

Monoscope. A special type of cathode ray tube which produces television picture signals corresponding to the design or picture which has been printed on its screen. This tube is used in television picture signal generators to provide a satisfactory signal source for television receiver test purposes during those times when no television station is on the air.

Morse Code. A system of dot and dash signals used in the transmission of messages by radio or wire telegraphy. The International Morse Code (also called the Continental Code) is used universally for radio telegraphy, while the American Morse Code is used only for wire telegraphy.

Mosaic. The photosensitive globules on their insulating mounting in the tube or Iconoscope of the television camera. The camera lens system focuses the image on the area of the mosaic.

Motor. A machine which converts electrical energy into mechanical energy.

Motorboating. Regeneration occurring at audio frequencies in a radio receiver or audio amplifier, resulting in put-put-put sounds resembling those made by a motorboat at sea.

Motor-Circuit Switch. A switch that will open the maximum operating overload current of a motor, the switch being rated in horsepower which is the same as that of the motor.

Motor-Generator. An electric motor directly connected to one or more generators for the purpose of converting a power line voltage to other desired voltages or frequencies.

Motor Starter. A hand-operated or magnetically operated contactor or heavy-duty switching device for opening and closing the circuit feeding a motor or motors as the motors are stopped and started.

Moving Coil Meter. A current-actuated electric meter consisting of a permanent magnet between the poles of which is suspended a wire coil through which flows all or part of the current to be measured. The coil is mounted between the poles and to it is attached the indicating pointer. The coil and pointer are moved by reaction between the magnetic fields of the permanent magnet and of the current-carrying coil.

Mu. Amplification factor.
NEON GLOW LAMP. A neon-filled gaseous tube having a glass envelope through which can be seen the characteristic red glow of neon when ionization occurs during operation of the tube.

NETWORK. An electric circuit in which the parts cannot be classified as series or parallel in series-parallel, but in which the connections are of some special nature suited to the purpose for which the circuits are to be used.

NEUTRAL. Having electric or electrostatic potential intermediate between the potentials of other associated parts in a circuit; positive with reference to some parts while negative with reference to others. Sometimes refers to zero potential, neither positive or negative.

NEUTRALIZATION. A term used in radio to describe any process which balances out or prevents an undesirable effect such as oscillation.

NEUTRALIZING TOOL. A small screwdriver or socket wrench, constructed partly or entirely from non-metallic materials, and used for making or breaking the adjustment in radio receivers. It eliminates the body capacity effects which would affect the accuracy of the adjustments if an ordinary metal wrench or screwdriver were used.

NICHROME. An alloy of nickel, iron, and chromium which has a high resistance per unit volume and is capable of withstanding high temperatures. It is extensively in the construction of wire-wound resistors, as well as in the heating elements of soldering iron and other electrical heating appliances.

NOISE. In radio, a term used chiefly in connection with interfering sounds heard along with desired programs.

NOISE FILTER. A device which is inserted between a wall outlet and the power cord plug of a radio receiver to block noise interference which otherwise would affect the receiver.

NOISE LIMITER. A special radio circuit which limits the effects of interfering noises by cutting off all noise peaks which are stronger than the highest frequency being received.

NOISE SILENCER. A special vacuum tube circuit which can be introduced into superhet radar to reduce the effects of static and man-made interference noises. Its chief value is in short wave communication receivers.

NOISE-REDUCING ANTENNA SYSTEM. An antenna system in which the only part capable of picking up signals is the high resistance antenna. This being connected high enough to be out of the noise-interference zone. The load-in is a special shielded cable or twisted two-wire line which can pass through the interference zone without picking up noise signals.

NON-CONDUCTOR. Any material which offers very high opposition to the flow of electricity. An insulating material.

NON-MAGNETIC. Materials such as glass, wood, copper, brass and paper which are not affected by magnetic fields.

NONMETALLIC SHEATHED CABLE. Wire or cable enclosed within and protected by a covering of insulating compounds and fabric braids in as high mechanical strength. Used for some building wiring where this cable is permitted.

OBSOLESCENCE-FREE. Not liable to become out of date because of new developments or new inventions. A term applied particularly to tube testers and other test instruments.

OCTAL BASE. A type of tube socket base having eight equally-spaced prongs and a central aligning key. When some of the prongs are not needed, they are omitted without changing the positions of the remaining prongs.

OCTAL GLASS-TYPE TUBE. A glass tube having an octal base.

OHM. The unit of electrical resistance. A watt is the unit of power and a volt is the unit of electric pressure. When a d.c. voltage of one volt will send a current of one ampere through that device. The Greek letter omega (ω) is commonly used to represent ohm.

OHMIC DROP. Potential difference due to flow of direct current through resistance.

OHMIC VALUE. The resistance in ohms which a part or circuit offers to the flow of direct current.

OHMMETER. A test instrument which measures and indicates directly the resistance of a part or the resistance between any two points in a circuit. It consists essentially of a milliammeter in series with a suitable d.c. voltage and suitable series or shunt resistors.

OHM'S LAW. A fundamental electrical law which expresses the relationship between voltage, current, and resistance in a direct current circuit, or the relationship between voltage, current and impedance in an a.c. circuit. The three forms of the law in each case are given below, in which E is the pressure in volts, I is current in amperes, R is resistance in ohms and Z is impedance in ohms.

D.C. FORMS
\[ E = I \times R \]
\[ I = E \div R \]
\[ R = E \div I \]

A.C. FORMS
\[ E = I \times Z \]
\[ I = E \div Z \]
\[ Z = E \div I \]

OHMS-PER-VOLT. A sensitivity rating for meters. It is obtained by dividing the resistance in ohms of any meter range by the full scale voltage reading of the meter at that range. The resistance of a device-volt meter, the more sensitive the meter.

OPERATOR. A person whose duties include the adjustment, maintenance and operation of radio transmitting equipment.

OSCILLATION. A condition whereby high-frequency currents are generated in a circuit.

OSCILLATOR. The stage in radio receiver, transmitter or other apparatus in which a vacuum tube and associated parts generate alternating current en-
ergy when fed with direct current energy. Thus, the oscillator stage in a superheterodyne receiver generates an r.f. signal of the correct frequency to produce the i.f. carrier signal when mixed with an incoming station signal. In a tetrodronic the oscillator stage generates the carrier frequency of the station or a frequency equal to some definite fraction of the assigned frequency.

OSCILLOGRAPH. A test instrument which records photographically the wave form of a varying current or voltage.

OSCILLOSCOPE. A test instrument which shows visually on a screen the wave form of a varying current or voltage.

OUTLET. A set of terminals from which electric power may be obtained. Thus, power at the a.c. line voltage may be obtained from a wall outlet in a building connected to an a.c. power system.

OUTPUT. The useful electrical energy delivered by a radio receiver, a.f. amplifier, electrical generator, or any other signal source.

OUTPUT IMPEDANCE. The impedance as measured between the output terminals of a radio device, receiver or amplifier at a definite frequency or at a predominant frequency in the audio range when the device is a handle. For maximum efficiency, the load impedance should match or be equal to this output impedance.

OUTPUT METER. A meter connected to the output of a receiver or amplifier for the purpose of measuring variations in output signal strength.

OUTPUT STAGE. The final stage in a receiver or a.f. amplifier. In a radio receiver, the output stage feeds the loudspeaker directly. In an a.f. amplifier, the output stage may feed into one or more loudspeakers, a transmission line, or a cutting head in the case of a sound recording system.

OUTPUT TRANSFORMER. An iron-core a.f. transformer used to provide efficient coupling between the output stage of a radio receiver or a.f. amplifier and its load.

OUTPUT TUBE. A tube designed for use in the output stage. It is a power amplifier tube, whereas the other tubes in a receiver are usually voltage amplifier tubes.

OVERCURRENT DEVICE. A protective device, such as a fuse or circuit breaker, which acts almost simultaneously to open a circuit when current in that circuit exceeds a certain predetermined value.

OVERLOAD DEVICE. A protective device, such as a thermally operated or heat-operated switch, that acts to open a circuit when an excessive load and excessive current have continued for long enough to bring temperature of the circuit wires nearly to the danger point.

Padder. In a superheterodyne receiver, the trimmer condenser placed in series with the oscillator tuning circuit to control the receiver calibration at the low-frequency end of a tuning range.

Patch. A sheet of metallic or non-metallic material on which the operating controls of a radio device such as a receiver, transmitter, or p.a. amplifier are mounted.

Panelboard. An enclosed panel or panelboard on which switches, over-current devices and other control elements in various combinations for the control of lighting, heating or power circuits or relatively small capacity such as used in individual buildings or sections of buildings.

Paper Condenser. A fixed condenser employing foil plates separated by paraffinized or oiled paper.

Parallel Connection. A connection of two or more circuits or parts between the same terminals of a source or current-supply circuit so that the same voltage difference is applied to all parts so connected and so that the current through each is proportionate to the change in resistance of the individual parts. The total current is equal to the sum of the currents in all the connected circuits or parts, and the total resistance or the effective resistance of all the parts in parallel is less than the individual resistance of any one of them.

Parallel Resonant Circuit. A tuning circuit consisting of a coil and capacitor. At resonance, it offers a high impedance, so that a large value of signal voltage is developed across it at the frequency to which it is tuned.

Peak. The maximum instantaneous value of a varying voltage or current.

Peak Value. Same as maximum value, which see.

Pentode. A vacuum tube having five electrodes. Ordinarily these will be the cathode, control grid, screen grid, suppressor grid and anode.

Period. The length of time required for one complete cycle of alternating current or voltage. As an example, the period for 60 cycles per second is 1/60 second.

Permanent Magnet. A piece of steel in which the particles are so lined up that the piece remains magnetized and continues to have a magnetic field without help from any external magnetism.

Permanent Magnet Dynamic Speaker. A moving coil speaker with its field supplied by a permanent magnet.

Permeability. A measure of the ease with which magnetic flux or magnetic lines of force may be established in a magnetic circuit. The ratio of the number of flux lines produced by an electromotive force having a unit of iron or steel to the flux produced by the same coil with no core other than air. The reciprocal of reluctance.

Permeability Tuning. Tuning of a transformer by means of adjustable iron-core inductance in place of tuning condenser.

Phase. In alternating current or voltage, the portion of a cycle or period through which the current or voltage has passed since going through zero value at the beginning of the cycle or period. The position of the current or voltage is specified in degrees, of what complete cycle or period. See Lag, Lagging Current, and Lead.

Phillips Screw. A screw having an indented cross in its head in place of a slot.

Phone. A headphone.

Phonograph Connection. A set of two terminals sometimes provided at the back of a radio receiver for making connections to a phonograph pickup. The terminals connect to the input of the a.f. amplifier. This connection permits use of the entire audio amplifier and loudspeaker to reproduce phonograph records.

Phonograph Oscillator. An r.f. oscillator served for modulation by the output of a phonograph pick-up, so that the resulting modulated r.f. signal can be fed to the antenna and ground terminals of a radio receiver. This permits using the entire receiver (rather than just the a.f. amplifier) for amplifying and reproducing phonograph records.

Phonograph Pick-up. A device which converts variations in the grooves of a phonograph record into corresponding audio signals. It consists essentially of a needle which converts record groove variations into mechanical movements, and a crystal, dynamic or photoelectric system which converts these mechanical movements into the audio signals.

Phosphor. Any fluorescent material used for the screen in a cathode-ray tube, an X-ray viewing screen, or a fluorescent lamp. The phosphor becomes luminous when struck by a stream of beta electrons.

Photocell. An evacuated or gas-filled bulb containing two electrodes, one of which is coated with substances which readily emit electrons when struck by visible light. With a voltage difference applied to the electrodes, current through the cell is proportional to the light reaching the light-sensitive electrode.

Photoconductive Cell. A device in which the property of selenium, by which its electrical resistance varies with changes of visible light striking the selenium or the cell.

Photoelectric Cell. Any device in which visible light varies the flow of electric current through the cell, thus inducing a unit in which changes of light produce corresponding changes of electric current.
PHOTOTUBE. A photocell, which see.

PHOTOVOLTAIC CELL. A device containing two electrodes immersed in a liquid, the cell, on exposure to light, producing an emf proportional to the visible light that falls upon one of the electrodes. It is essentially a primary voltaic cell whose output varies with changes of light intensity.

PICTURE ELEMENT. In a television system, the smallest portion of a picture or scene which is individually converted into an electrical signal and transmitted.

PICTURE FREQUENCY. In television, the number of complete pictures which are scanned and transmitted in one second.

PICTURE TUBE. In a television receiver, the cathode-ray tube on whose screen the image of the scene being scanned at the television transmitter.

PIEZO-ELECTRIC EFFECT. A property of crystals of quartz and some other substances by which their form or dimensions are varied by application of electric charges to opposite faces. The original dimensions and manner of cutting of the crystal determine the frequency of applied voltage at which the crystal is resonant and vibrates most, thus being the frequency which will be maintained within very narrow limits in a suitable resonant circuit containing the crystal.

PIGTAIL. A flexible connection between a stationary terminal and a part or terminal which has a limited range of motion.

PILOT LAMP. A small lamp mounted on the panel of a radio receiver to illuminate the tuning dial, or the panel of other apparatus to indicate when the apparatus is turned on.

PLASTIC. A general term used in connection with any of the black or colored materials used for molding radio receiver cabinets, control knobs, tubes, bases, sockets, and the insulating portions of many other radio parts. It is an exciting molding material and has a natural smooth glossy surface which requires no finishing or polishing operations after molding.

PLATE. The anode in a radio tube. It is usually at a high positive potential with respect to the cathode, and therefore attracts the electrons emitted by the cathode.

PLATE CIRCUIT. A circuit including the plate voltage source and all other parts connected between the cathode and plate terminals of a radio tube.

PLATE CURRENT. The current flowing through the plate circuit of a radio tube and between the plate and cathode inside the tube. The electrons which make up the plate current always flow in the direction from the cathode to the plate.

PLATE SUPPLY. The voltage source used in a vacuum tube circuit to plate the plate at a high positive potential with respect to the cathode. The plate supply voltage is always higher than the actual plate voltage, because of the voltage drops across resistance in the plate circuit.

PLATE VOLTAGE. The d.c. voltage existing between the plate and cathode terminals of a radio tube.

PLUG. A connecting device at the end of a flexible cord, used for making an instantly-removable connection to a grounded terminal jack or outlet.

PLUG FUSE. A fuse so mounted as to screw into its holder.

PLUG-IN COIL. A coil having as its terminals a number of progs arranged to fit into a socket mounted on the radio chassis. With this the tuning range of a receiver or transmitter can be changed simply by pulling out one coil and inserting another in the socket.

POLARITY. In a radio part or circuit, the quality of having two opposite charges, one negative and the other positive. In a magnetic circuit or part, the quantity or having two poles, one North and the other South.

POLE. One end of a magnet. One electrode of a battery.

POLICE CALLS. Broadcasts or calls made by police radio stations. Many modern single-band receivers are capable of receiving police radio stations operating on frequencies between 1626 kc. and 1712 kc. (just beyond the high-frequency end of the broadcast band).

POLARIZATION. Reduction of the terminal voltage of a cell, due to formation of hydrogen gas on the surfaces of the cell electrodes and to the accompanying counter-emf produced in the cell.

POLARIZED. 1. A polarized bell or relay is one whose armature is a permanent magnet and which operates in accordance with the direction of current through its windings. 2. Marked, colored, or otherwise identified for the correct connection of positive and negative wires, grounded and ungrounded wires, or other conductors.

PORTABLE APPLIANCE. An appliance to which current is furnished through a flexible cord and attachment plug, permitting the appliance to be moved and connected to various sources.

POSITIVE. A term used to describe a terminal having fewer electrons than normal, so that it attracts electrons in seeking to return to its normal state. Thus, electrons flow into the positive terminal of a voltage source.

POSITIVE CHARGE. The electrical condition of a body which has less than the normal quantity of negative electrons, so that the body has a negatively electricity rather than which is uncharged, or exhibiting no electrical effect.

POSITIVE FEEDBACK. Regeneration, causing an increase in signal strength.

POSITIVE MODULATION. In television, a method of transmission in which an increase in scene illumination causes an increase in the radiated power of the transmitter.

POWER. The rate at which electrical energy is delivered and consumed. Electrical power is measured in watts.

POWER AMPLIFIER STAGE. An audio amplifier stage which is capable of delivering a large amount of audio power without distortion. An r.f. amplifier stage in a transmitter which serves primarily to increase the power of the r.f. carrier signal.

POWER FACTOR. The ratio of the voltage and current, or volt-amperes, that do useful work in an alternating-current circuit or alternating-current equipment to the total voltage and current, or volt-amperes, flowing in the circuit. In circuits containing much inductance or much capacitance in addition to their resistance the total current is more than the current that produces useful work, so that such circuits have relatively low power factors. In circuits containing only resistance all the current and voltage do useful work, so that the ratio is one-to-one or unity, being the highest possible power factor.

POWER FACTOR CORRECTION. The addition of capacitance to an alternating-current circuit containing a great deal of inductance, so that the capacitive reactance balances out a large portion of the inductive reactance, thus lessening the amount of current and making a higher power factor for the circuit. Inductance might similarly be added to a circuit containing excessive capacitance.

POWER LEVEL. The amount of electrical power passing through a given point in a circuit. Power level can be expressed in watts, in decibels, or in volume units.

POWER LEVEL INDICATOR. An a.v. meter which is calibrated to read in terms of audio power level.

POWER PACK. The power supply unit of a radio receiver, amplifier, transmitter, or other radio apparatus. Its function is to convert available direct current power line or storage battery voltage to the values required by filament, grid and plate circuits.
POWER TRANSFORMER. An iron-core transformer having a primary winding which is connected across the a.c. power line, a high-voltage secondary winding for the power amplifier tube, and one or more low-voltage secondary windings which supply the required a.c. voltages to the tube filaments.

POWER OUTPUT TUBE. A radio tube especially designed for use in the a.f. output stage of a radio system. It is capable of handling much greater current than the ordinary amplifier tube, and hence delivers high output power.

PRESELECTOR. That circuit or r.f. amplifier stage in a superheterodyne receiver which amplifies the incoming modulated r.f. signal before it is converted to the i.f. signal by the oscillator-mixer-first detector section.

PRI. Primary.

PRIMARY. First in order of time, placement, development or importance.

PRIMARY CELL. A voltaic cell or battery cell in which, when current is produced, the chemicals of the cell elements are changed to such forms that they cannot be restored to their original active condition by sending a reverse current through the cell, thus making the cell useless after having delivered a certain number of ampere-hours of electricity.

PRIMARY WINDING. The input winding of a transformer. It can be identified by the fact that r.f. a.f. or power line alternating current or pulsating direct current is sent through this winding.

PROTON. One of the positively charged particles which, together with electrons (negatively charged particles), make up the structure of an atom.

PUBLIC ADDRESS AMPLIFIER. An audio amplifier capable of supplying sufficient power to loudspeakers for adequate sound coverage of public gatherings.

PUBLIC ADDRESS SYSTEM. A complete system for reproducing voice and speech with adequate volume for large public gatherings. It includes one or more microphones, a powerful audio amplifier with suitable power supply, and a sufficient number of loudspeakers to give coverage of the auditorium, stadium, or large space. Most installations also include a phonograph which may or may not be of the automatic record changer type.

PULSATING CURRENT. A current which changes in value but not in direction. It can be considered as a direct current combined with a smaller value of alternating current.

PULSE. A momentary sharp change in a current or voltage.

PUSH-BACK HOOP-UP WIRE. Tinned copper hook-up wire covered with a loosely wound cotton insulation which can be pushed back from the end of a wire length with the fingers to expose sufficient bare wire for a connection. Radio men use this type of wire almost exclusively for experimental and repair work.

PUSH-BUTTON TUNER. A tuning unit which automatically tunes a radio receiver to a station when the button assigned to that station is pressed. In electrical automatic push-button tuning, the button actuates switches which connect a set of pre-adjusted trimmer condensers into the receiver tuning circuits. In electromechanical automatic push-button tuning, the button controls the starting and stopping circuits of a small motor which rotates the regular gang tuning condenser of the receiver. In mechanical automatic push-button tuning, pressure on the button is transferred by a lever or cam system into a force which rotates the gang tuning condenser to the correct position for the desired station.

PUSH-PULL CIRCUIT. A two-tube audio output circuit so arranged that both tubes operate simultaneously and their individual a.f. plate currents add in the common load to give twice the output of a single tube. This circuit arrangement has the added advantage that it balances out all even harmonics which would otherwise cause distortion.

PUSH-PULL TRANSFORMER. An iron-core a.f. transformer designed for use in a push-pull amplifier circuit. If it is the input transformer, it will have a center-tapped secondary winding. If it is the output transformer, it will have a push-pull secondary winding.

PUSH-PUSH CIRCUIT. A two-tube audio output circuit so arranged that the tubes operate alternately in a common load.

Q FACTOR. A rating used to express certain characteristics of coils and resonant circuits. It is obtained by dividing reactance by ohmic resistance.

Q SIGNAL. One of the three-letter abbreviations in the International List of Abbreviations, used to represent complete sentences in radio telegraphy. When the question form of the sentence is intended, the code signal for an interrogation mark is sent after the abbreviation. Thus QRM means "Are you being interfered with?" and QRMQ means "Are you being interfered with?" and QRM means "Are you being interfered with?"

QUARTZ-CRYSTAL. A thin slab about the size of a half-dollar, cut from a natural crystal of the mineral quartz and carefully ground to a thickness which will make it vibrate at the desired natural frequency when supplied with energy. It is used as the master carrier frequency source in the crystal oscillator stage of a radio transmitter.

R. Resistance.

RACEWAY. Any enclosure designed for and used only for holding wires, cables or bus-bars; includes all types of conduit, whether of metal or of insulating material, and all similar wire channels.

RADIATION. The process wherein the transmitting antenna system of a radio station converts the modulated r.f. output of the transmitter into radio waves which travel away from the station through space.

RADIATION PATTERN. A diagram showing how well an antenna system radiates or picks up radio waves in various directions.

RADIO. Communication by means of radio waves. An a.m. receiving set capable of picking up radio waves and reproducing the intelligence they convey. This intelligence may consist of speech, music, code signals, writing, printed matter, photographs, motion pictures, actual scenes, etc. In space radio, which is the conventional form, radio waves are transmitted through space. In wired radio, the radio waves are guided by conductors.

RADIO BEACON. A stationary radio transmitter which sends out special identifying signals continuously. Radio receivers on ships at sea and on aircraft in flight can tune to a radio beacon, thus determining their position with respect to the beacon location.

RADIO BROADCASTING. A one-way transmission of voice and music to anyone within receiving range of the radio station.

RADIO COMPASS. A radio direction finder used chiefly in marine and aircraft radio stations for navigational purposes.

RADIO CONTROL. The control of moving objects such as airplanes, automobiles, ships, torpedoes, etc., by means of single or two-way radio waves, received from the transmitter location to special radio receiving equipment in the object begin controlled.

RADIO FREQUENCY. Any frequency in the radio spectrum above the highest audible frequency which is about 20,000 cycles. This term is also used in connection with radio parts designed for use at frequencies higher than the audio frequency range. Abbreviated r.f.

RADIO FREQUENCY AMPLIFIER. A vacuum tube amplifier stage to provide amplification at radio frequencies. In a t.r.f. receiver, all stages ahead of the detector are r.f. amplifier stages. In a superheterodyne receiver, the amplifier stage sometimes used ahead of the first detector in the pre-selector is an r.f. amplifier stage.

RADIO FREQUENCY CHOKER. A choke coil designed to have high direction and impedance at radio frequencies, so that it limits or blocks the flow of r.f. currents.

RADIO FREQUENCY TRANSFORMER. An air-core or pulsed iron-core transformer used in r.f. circuits.

RADIO METAL LOCATOR. A radio instrument which indicates the presence of metal within its operating range by a change in meter reading or a change in a tone signal heard in headphones. Used for determining positions of buried pipe lines, buried metal objects, metal objects concealed in the clothes of prisoners, metal objects imbedded in loose or solid beds, to be shaved, deposits of metallic minerals, etc.

RADIO METEOREOGRAPH. A combination meteorograph and radio transmitter carried aloft by an unmanned gas-filled rubber balloon and so designed that it will transmit back to earth radio signals which can be interpreted in terms of the pressure, tem-
RECORDER. An instrument which makes a permanent record of a varying electrical signal. Thus, code messages are recorded on paper tape by a clock-driven printer, while voltage is recorded on discs or other materials by a sound recorder. Pictures and printed matter transmitted by radio are reproduced on paper by a facsimile recorder.

RECTIFIER. A device which changes an alternating current into a pulsating direct current. It may be a vacuum tube, gaseous tube, crystal, vibrator or copper-oxide device.

RECTIFIER METER. A moving coil direct-current meter equipped with a rectifier which alters the electric current or voltage to be measured into direct current or voltage which will operate the meter and cause it to indicate.

REGENERATION. A method of securing output from an amplifier by feeding a part of the amplifier output back to the amplifier input in such a way that reinforcement of the input signal is obtained. With this arrangement, a signal passing through the same amplifier over and over again, with an increase in strength each time.

REGENERATION CONTROL. A rheostat, potentiometer, or variable condenser which is used in a regenerative receiver to control the amount of signal which is fed back from output to input in the regenerative detector stage.

GENERATIVE DETECTOR. A vacuum tube detector in which the feedback of r.f. energy from the plate circuit to the control grid circuit produces regeneration.

REGENERATIVE RECEIVER. A radio receiver which employs controlled regeneration to increase the amplification provided by a vacuum tube stage (usually the detector stage).

RELAY. An electromagnetic device which permits control of current in one circuit by a much smaller current flowing in another circuit.

REMOTE CONTROL. Operation of radio transmitting or receiving equipment from a remote point.

RESISTANCE. The opposition which a device or material offers to the flow of direct or alternating current. The opposition which results in production of heat in the material carrying the current. Resistance is measured in ohms, and is usually designated by the letter R.

RESISTANCE COUPLING. A type of coupling in which a resistor and condenser provides a path for signal energy between two circuits.

RESISTIVITY. The resistance in ohms which a unit cube of a material offers to the flow of electric current.

RESISTOR. A radio part which offers resistance to the flow of electric current. Its electrical size is specified in ohms, but sometimes in megohms (1,000,000 ohms). A resistor also has a power-handling rating in watts, indicating the amount of power which can safely be dissipated as heat by the resistor.

ROENTGEN RAYS. Same as X-rays.

ROSIIN-CORE SOLDER. Solder which has as its core the correct amount of rosin flux for effective radio soldering work. The rosin is released automatically when the solder is applied to the heated joint.
ROTOR PLATES. The movable plates of a variable condenser. They are usually connected directly to the metal frame of the condenser.

ROTOR BEAM ANTENNA. A highly directional short wave receiving or transmitting system mounted on a high pole or mast in such a way that it can be rotated to any desired positions either manually or by an electric motor drive.

ROTOR SWITCH. Any switch which is operated by rotating its control knob.

R.P.M. Revolutions per minute.

S. A letter sometimes used to designate the secondary winding of a transformer.

SAPPHIRE. A gem used in the tips of high-grade phonograph needles and in cutting needles used with sound recorders.

SCALE. A series of marks printed on a flat surface over which the pointer of a meter moves. The value of the mark directly behind the pointer corresponds to the meter reading.

SCANNING. In television, the process by which an image of a scene to be transmitted and reproduced has its lights and shades changed into corresponding changes of voltage and current for each small element or area of the scene, these electrical changes being transmitted and then reconverted into lights and shades at the receiver.

S.C.C. Single cotton covered insulation on a wire.

S.C.E. Single cotton covering over an enamel insulating layer on a wire.

SCHEMATIC DIAGRAM. A diagram which shows electrical connections of a radio device by means of symbols which are used to represent the radio parts.

SCRATCH FILTER. A filter circuit used in connection with a phonograph pickup to block those frequencies at the higher end of the audio range at which needle scratch is most prominent.

SCREEN. In a television picture tube or a cathode-ray tube, the internal coating of fluorescent material which is made to glow by the electron beam in reproducing pictures or lines.

SCREEN GRID. An electrode mounted between the control grid and plate of a vacuum tube for the purpose of reducing the capacity between these two electrodes.

SCREEN GRID TUBE. A vacuum tube having a screen grid. It may be a normal tube. In the latter case, it is more often called a screen grid pentode.

SCREEN GRID VOLTAGE. The d.c. voltage which is applied between the screen grid and the cathode of a vacuum tube to make the screen grid highly positive with respect to the cathode.

SEC. Secondary.

SECONDARY CELL. A d.c. voltage source which is capable of storing electrical energy. When exhausted, it can be recharged by sending direct current through it in the reverse direction. Each cell of an ordinary storage battery is a secondary cell.

SECONDARY EMISSION. Emission of electrons from a cold electrode when it is hit or bombarded by high-speed electrons.

SECONDARY WINDING. The coil or winding of a transformer which is connected to the load, the coil from which the transformer draws its current.

SECONDARY WINDING. Any of the output windings in a transformer.

SELECTIVITY. The degree to which a radio receiver is capable of reproducing signals of one station while rejecting signals from all other stations.

SELF-BIAS. Referring to a vacuum tube stage which produces its own grid bias voltage. Plate current flowing in a resistor in series with the cathode lead produces across this resistor the voltage drop used for grid bias purposes. Also called automatic C bias.

SELF-INDUCTANCE. The property of a circuit whereby any change of current flowing in the circuit produces a counter emf that opposes the change that is taking place, an emf that tends to prevent an increasing current from increasing, and tends to prevent a decreasing current from decreasing. Measured in henrys. The symbol is L.

SENSITIVITY. In electrical measuring instruments, a measure of the current, voltage or power required to operate the instrument and to cause its indicator to move. The less the required power the higher the sensitivity.

SERIES CONNECTION. A connection in which the same current must flow through each of the series-connected parts. When dry cells or batteries are connected in series so that their voltage add, the minus terminal of one cell must be connected to the plus terminal of the next cell.

SERIES-PARALLEL Descriptive of a circuit or part of a circuit in which some parts or elements are connected together in series, with these groups connected together in parallel; or parts connected in parallel and the groups in series.

SERIES RESONANT CIRCUIT. A circuit in which a coil and condenser are connected in series, and have values such that the inductive reactance of the coil will be equal to the capacitive reactance of the condenser at the desired resonant frequency. At resonance, the current through a series resonant circuit is a maximum.

SERIES WINDING. In a motor, generator or other electric machine, a winding in which flows all the current that enters or leaves the machine.

SERVICE. The conductors and equipment with which the delivery of energy and power from a transformer, feeder or main of a public service distribution system to the wiring system of a building or premises in which the power is utilized.

SERVICE AREA. The region around a broadcast station in which its signal strength is strong enough to insure satisfactory reception at all times.

SERVICE ENTRANCE. Descriptive of equipment and conductors used at the point where building wiring connects to the service.

SETTING. The current at which or in excess of which a circuit breaker or other adjustable protective device will operate to open its circuit.

SG. Letters used to designate the screen grid electrode of a vacuum tube.

SHADEN POLE MOTOR. An alternating-current induction motor which is self-starting on single-phase current supply because of a partial displacement of magnetic lines or flux at the field poles through auxiliary currents and flux produced in closed conductive rings around parts of the pole tips.

SHADOW TUNING INDICATOR. A tuning meter which has a small piece of cardboard attached to its pointer, with a pilot lamp mounted behind the pointer so that the shadow upon a glass screen. The meter is so constructed and connected into a radio receiver circuit that the shadow will be narrowed when the receiver is accurately tuned to a station.

SHIELD. A metal can or housing placed around a radio part to prevent its electric and magnetic fields from affecting nearby parts or to prevent other fields from affecting it.

SHIELDED WIRE. Insulated wire having around it a shield of tinned braid or copper wire.

SHIELDING CIRCUIT. A low-resistance connection, usually accidental, occurring between the two sides of a circuit or between any two circuit terminals; it often results in excessive current flow and damage to some parts.

SHORT WAVES. Wavelengths shorter than those included in the broadcast band, hence waves shorter than 200 meters. Short waves correspond to frequencies higher than the highest broadcast band frequency of 1600 kilocycles.

SHORT-WAVE CONVERTER. A radio device which can be connected between a broadcast receiver and its antenna system to permit reception of higher-frequency stations which the receiver could not otherwise receive. It consists essentially of an oscillator-mixer-first detector arrangement like that used in a superheterodyne receiver, and serves to convert the high-frequency signal to a broadcast band frequency which can be handled by the regular receiver.

SHUNT. A resistor placed across the terminals of an ammeter to allow a definite part of the circuit current to flow around the meter. Any parallel-connected resistor, say, by placing one part in parallel with another.

SHUNT WINDING. In a motor, generator or other electric machine, a winding through which flows only a portion of the total current entering or leaving the winding which is in parallel with the armature windings.

SIGNAL. A radio wave or alternating current which carries intelligence of any form. More generally, any alternating current having other than an a.c. power line frequency.
SNAP SWITCH. A switch in which movement of the control member first places tension on a spring, after which the spring tension is released to sudden close (usually to suddenly open) the switch contacts.

SOCKET. A mounting device for tubes, plug-in coils, plug-in condensers, plug-in resistors and crystals, having holes with spring clips arranged to fit around the terminal prongs of the part being plugged in. Also, a bayonet or screw type socket for pilot lamps.

SOLDER. An alloy of lead and tin which melts at a fairly low temperature and is used in radio for making permanent electrical connections between parts and wires.

SOLDERING IRON. A device used to apply heat to a joint which is to be made permanent by soldering.

SOUND. A vibration of a body at a rate which can be heard by human ears. The extreme limits of human hearing are about 20 cycles and 20,000 cycles. Sound can travel through any medium which possesses the ability to vibrate; the non-vibrating regions are called sound waves.

SOURCE. A term sometimes used to describe the part which is supplying electrical energy or radio signals to a circuit.

SPACE CHARGE. A gathering of electrons near the cathode of a vacuum tube. Being negative, it tends to limit the number of electrons which can reach the plate, and hence limits the plate current.

SPAGHETTI. Heavily varnished cloth tubing sometimes used to provide additional insulation for radio circuit wiring.

S.P.D.T. SWITCH. Single pole, double throw switch.

SPECIFIC GRAVITY. The ratio of the weight or mass of a substance to the weight or mass of an equal volume of pure water at the same temperature, or sometimes at a reference temperature of four degrees centigrade.

SPEED CONTROLS. In a television receiver, the adjustable controls that set the operating frequencies of the vertical and horizontal oscillators at values which permit them to fall into step with or synchronize with the incoming signal.

SPIDER. A highly flexible fiber ring which serves to center the voice coil of a dynamic loudspeaker without appreciably hindering the in-and-out motion of the voice coil and its attached diaphragm.

SPICE. A joint between two wires which possesses mechanical strength as well as good electrical conductivity.

SPLIT PHASE MOTOR. An alternating-current induction motor which is motorized by self-starting on single-phase current by using two stator windings, in one of which the current is displaced in phase with reference to that in the other winding so that a rotating field is created, like the rotating field secured from two-phase current.

S.P.S.T. SWITCH. Single pole, single throw switch.

SQUEALING. A condition in which a high pitched note is heard along with the desired tone. This can be due to interference between stations or to a number of other causes.

SQUIRREL CAGE MOTOR. An alternating-current induction motor in which the conductors on the rotor bars parallel the rotor axis or shaft, rather than at the front and rear of the armature by conductive rings. The conductors, neglecting their supports, would have the general form of a squirrel cage.

S.S.C. Single silk covered wire.

STANCHIOFF INSULATOR. An insulator used to support a wire at a desired distance away from the building or other support on which the insulator is mounted.

STATIC. Interfering noises heard in a radio receiver due to radio waves created by current disturbances such as discharges of lightning.

STATOR. The fixed set of plates in a variable condenser.

STATOR. The parts of an alternating-current motor or generator on which the stationary windings.

STEP-DOWN TRANSFORMER. A transformer in which the secondary winding has fewer turns than the primary, so that the secondary delivers a lower voltage than is supplied to the primary.

STEP-UP TRANSFORMER. A transformer in which the secondary winding has more turns than the primary so that the secondary delivers a higher voltage than is applied to the primary.

STORAGE BATTERY. One or more secondary or storage cells connected together, usually in series.

STORAGE CELL. A secondary cell. More specifically, one of the cells of the ordinary automotive storage battery, delivering a voltage slightly higher than two volts and capable of being recharged.

STRANDED WIRE. A wire which consists of a number of finer wires twisted together.

SULPHATION. In a lead-acid storage battery, the conversion during discharge of an excessive amount of the active material and peroxide of lead into inactive sulphate of lead.

SUPERHETERODYNE RECEIVER. A type of radio receiver in which the incoming modulated r.f. signals are amplified a small amount in the preselector, then fed into the frequency converter section (consisting of the oscillator, mixer and first detector) for conversion into a fixed, lower carrier frequency called the i.f. value of the receiver. The modulated i.f. signals are given very high amplification in the i.f. amplifier stages, then fed into the second detector for demodulation. The resulting audio signals are amplified in the conventional manner by the audio amplifier, then reproduced as sound waves by the loudspeaker.

SUPPRESSOR. A resistor inserted in series with the spark plug lead or the distributor lead of an automobile engine to suppress spark interference which might otherwise interfere with reception of radio programs in the automobile set.

SURFACE METAL RACEWAY. A thin-walled flattened metallic covering and support for insulated wires, de-
SPECIAL DIAGRAMS. A special oscillator circuit which generates a voltage having a sawtooth wave form suitable for making the electron beam of a cathode ray tube sweep back and forth across the fluorescent screen.

SWITCHBOARD. A large exposed panel or panels carrying on the front, back, or front and back, switches, buses, protective devices and instruments for measuring and indicating or recording values of current and voltage in parts of circuits controlling by equipment on the switchboard.

SYMBOL. A simple design used to represent a radio part on a schematic diagram circuit. A letter used in formulas to represent a particular quantity.

SYNC SEPARATOR. In a television receiver, the filter system that separates the synchronizing signal from the other received signals.

SYNC SIGNAL. A synchronizing signal in television.

SYNCHRONIZING SIGNAL. The portion of a television signal that keeps the motions of the electron beam in the picture tube of the receiver in step with or synchronized with motions of the beam on the camera tube at the transmitter.

SYNCHRONOUS. Happening at the same time; having the same alternating phase relations and period; maintaining vibrations in exact proportions to output speed, or a speed exactly proportional to supplied frequency.

SYNCHRONOUS VIBRATOR. A vibrator which serves the dual function of converting a low d.c. voltage to a low a.c. voltage and at the same time rectifying a high a.c. voltage. When used in an automatic radio power pack, it eliminates the need for a rectifier tube.

TABLE MODEL RECEIVER. A radio receiver having a cabinet of suitable shape and size to permit placing on a table.

TAP. A connection made to a point intermediate between the ends of a coil, and between the parts of a circuit, or other element in a circuit or line.

TELEVISION. Reproduction of a scene, which may include moving objects and persons, at a distance from the point where the scene exists. Television requires the conversion of lights and shades of a scene into variations of voltage and current, transmission of these variations as radio waves, and reconversion at the receiver of the voltage and current input into lights and shades, all at practically the same instants that changes are occurring in the distant scene.

TELEVISION CONNECTION. Terminals which permit the use of an ordinary radio receiver in amplifying and reproducing the audio signals associated with a television program. These terminals simply connect to the input of the audio amplifier in the receiver just as one would to the phonograph connection terminals.

TERMINAL. A point to which electrical connections are made.

TEST LEAD. A flexible insulated lead used chiefly for connecting meters and test instruments to a circuit under test.

TEST PROD. A sharp metal point provided with an insulated handle and mounted in a hub or screw for testing on parts of an electric current. Excessive current causes excessive heating, and the expansion that operates the device. In other styles the overheating melts a fusible metal which releases the operating parts.

THERMOCOUPLE. A device that converts heat directly into emf and electric current. The thermocouple consists of two metals, such as cooper and constantan, directly in contact at a point which is heated and either directly in contact or connected through a meter or similar unit at a point kept relatively cool. The emf is proportional to the difference between temperatures at the hot and cold junctions.

THERMOCOUPLE METER. A moving coil meter equipped with a thermocouple heated by alternating current to an emf and producing a direct current that indicates the magnitude of the alternating current.

THERMOSTAT. A device in which changes of temperature cause expansion and contraction of an element whose resulting motion operates switches or other control devices in electric circuits.

THREE-BAND RECEIVER. A radio receiver having three different tuning ranges. One range will always include the broadcast band, and may also include police stations operating on frequencies just above the broadcast band. The other two ranges will usually be from about 2.2 mc. to about 7.5 mc. and from about 7.25 mc. to about 12 mc.

THREE-WAY SWITCH. A switch that connects one of its terminals alternately to two other terminals, used in a circuit for controlling a single lamp from two different locations.

TRANSFORMER SYSTEM. A direct-current supply in which the voltage from one wire, called the neutral, to either of the others is half that which exists between the other two wires. For example, the voltage from the neutral to either side wire may be 110, and between the two outside wires may be 220.

TICKLER. A coil connected to series with the plate circuit for the purpose of feeding a portion of the amplified signal current back into the grid circuit by induction for repeated amplification. The tickler is used chiefly in regenerative detector circuits.

TIME DELAY DEVICE. A device used after a low power to break a circuit which operates only after a period of time following some change of current or voltage, or some other action in an electrical system.

TIME SIGNALS. Naval Observatory, air traffic controllers, radar stations, regularly each day by government radio station NAA in Arlington, Virginia on a number of different frequencies. They can generally be picked up during normal daylight hours on a well-equipped receiver, from 9,425 kc. by a good all-wave receiver. These signals are used by army and navy stations, ships at sea, jewelers, and other persons throughout the entire country to keep time and date times. NAA signals are re-broadcast by some broadcasting networks at certain hours.

TOGGLE SWITCH. A small switch operated by means of a lever.

TOLERANCE. The permissible variation from a rated or assigned value.

TONE. The general character of a reproduced radio program as it affects the human ear.

TOUREL CONTROL. A circuit control sometimes provided on a radio receiver to permit strengthening the response at either low or at high audio frequencies at will, so as to make the reproduced radio program more pleasing to a particular audience.

TOP CAP. A metal cap sometimes placed on the top of a vacuum tube and connected to one of the electrodes, usually the control grid.

TORQUE. Turning effort. The effect of a force that tends to cause rotation of parts about a center. An electric motor exerts torque at its shaft when supplied with electric current, and if the torque is sufficiently great it will cause the shaft to rotate.

TRACKING. A term used to indicate that all of the tuned circuits in a receiver follow the frequency indicated by the tuning dial pointer as the receiver is tuned over its entire tuning range.

TRANSCRIPTION. An electrical transcription, in which a complete radio program is recorded for future use.

TRANSFORMER. A device usually composed of two insulated windings on a common iron or steel core, in which alternating currents supplied to one winding (the primary) induces electromagnetic induction alternating currents (the secondary) and will produce alternating currents in a conductive circuit connected to the secondary winding. The voltage from the secondary may be higher, lower, or equal, but will be furnished to the primary winding. See Step-Down and Step-Up Transformers.

TRANSMISSION LINE. Any set of conductors used to carry r.f. or a.f. signals or energy from one location to another.

TRANSMITTER. A comprehensive term applying to all of the equipment used for generating and amplifying an r.f. carrier signal, modulating this carrier with intelligence, and radiating the modulated r.f. carrier into space after
it is amplified additionally and fed to the transmitting antenna.

TREBLE. A term sometimes used to designate high audio frequencies.

T.R.F. Tuned radio frequency.

TRIMMER CONDENSER. A small semi-adjustable condenser, usually adjusted with a screwdriver, and used in the tuning circuits of radio receivers and other radio apparatus to permit accurate alignment of these circuits.

TRIODE. A three-electrode vacuum tube, usually having a cathode, control grid and anode.

TRUE POWER. The power actually consumed in an alternating-current circuit or equipment, is distinguished from the apparent power which would be equal to the number of volts multiplied by the number of amperes input to the circuit. See Power Factor. Power factor is the ratio of true power to apparent power.

TUBE. A vacuum tube, gaseous tube or photoelectric cell mounted in a somewhat tube-shaped glass or metal envelope.

TUBE TESTER. A test instrument used to test the condition of radio tubes.

TUBULAR CONDENSER. A paper or electrolytic condenser having as its plates long strips of foil which have been rolled into a compact tubular shape.

TUNED CIRCUIT. A resonant circuit, consisting of a coil and condenser which are preset or can be adjusted to give resonance at a desired frequency.

TUNED RADIO FREQUENCY RECEIVER. A receiver in which r.f. amplification is provided by a number of vacuum tube amplifier stages, each of which has one or more circuits which are tuned to resonance at the incoming signal frequency by a section of the gang tuning condenser. The amplified r.f. signals are fed directly into the detector for demodulation.

TUNGAR BULB. A gaseous diode rectifier tube employed in battery chargers.

TUNGSTEN. A pure metal used in radio chiefly for the filaments and other elements of radio tubes.

TUNING. The process of varying the inductance or capacity in a coil-condenser circuit to provide resonance at a desired frequency. Also, the process of setting all of the tuning circuits in a radio receiver simultaneously to a desired frequency by rotating the tuning dial or pressing a button of a push-button tuner.

TUNING EYE. A cathode ray tuning indicator.

TUNING INDICATOR. A device which indicates when a radio receiver is tuned accurately to a radio station.

TUNING METER. An ordinary meter connected into a radio receiver circuit for use as a tuning indicator.

TURN. In a coil, one complete loop of wire around the coil form.

TURNTABLE. In a record player or electric phonograph, the motor-driven disc on which the phonograph record is placed. In a sound recorder, the motor-driven disc on which is placed the disc to be cut.

TWO-BAND RECEIVER. A radio receiver having two reception ranges. One band covers frequencies from 335 kc. to 1720 kc., which includes the broadcast band and some police calls, and the other will generally be between 105 mc. and 18.1 mc.

TWO-PHASE. Descriptive of an alternating current circuit or equipment in which there are at the same time two voltages and two currents differing in phase position by 90 electrical degrees.

ULTRA-HIGH FREQUENCY. A term usually used to indicate a frequency higher than about 30 megacycles. Abbreviated u.h.f.

UNIVERSAL OUTPUT TRANSFORMER. An iron-core a.f. output transformer having a number of taps on its windings to permit its use in practically any average radio receiver.

UNIVERSAL RECEIVER. A receiver capable of operating from either a.c. or d.c. power.

UNMODULATED. Without modulation. The r.f. carrier signal alone, as it exists during pauses between station programs.

V. Voltage. Volts.

VACUUM. A space from which practically all air has been removed.

VACUUM TUBE. A device consisting of a number of electrodes mounted in an envelope or housing from which practically all air has been removed. Also called an electron tube or radio receiver.

VACUUM TUBE VOLTOMETER. A test instrument which utilizes the rectification characteristic of a vacuum tube for measuring voltages without affecting the circuit to which the instrument is connected.

VALVE. The term used in Great Britain to designate radio tube.

VARIABLE CONDENSER. A condenser whose capacity may be changed either by varying the space between plates (as in a trimmer condenser) or by varying the amount of meshing between the two sets of plates (as in a tuning condenser).

VARIABLE RESISTANCE. A resistance which can be changed in value while in use.

VERNIER CONDENSER. A small variable tuning condenser which is placed in parallel with a larger tuning condenser for the purpose of providing a finer adjustment after the large condenser has been set roughly to the desired position.

VERNIER DIAL. A type of tuning dial in which a complete rotation of the control knob makes the tuning condenser shaft rotate only a small fraction of a revolution, thereby permitting fine and accurate tuning.

VERTICAL ANTENNA. A single vertical metal rod, suspended wire or metal tower used as an antenna.

VERTICAL OSCILLATOR. In a television receiver, the oscillator that utilizes the vertical synchronizing and blanking signals so the defocusing signals to produce voltages which, when amplified, operate the deflection plates or coils in the picture tube.

VIBRATOR. An electromagnetic device which converts a d.c. voltage to pulsating d.c. or a.c. It is used in the power packs of auto radios and some public address amplifiers to convert the 6-volt auto storage battery voltage to a low a.c. voltage. The a.c. voltage is then stepped up by a power transformer, and converted into a high d.c. voltage either by a conventional rectifier tube circuit or by an extra set of contacts on the vibrator itself.

VIDEO. A Latin word meaning "I see," applied to television parts and circuits which handle picture signals, and applied also to signals associated with the picture being transmitted.

VIDEO AMPLIFIER. The amplifier for video signals in a television receiver or transmitter.

VIDEO FREQUENCY. One of the frequencies present in the output of a television camera as a result of scanning the image being transmitted. It may be any value from almost zero to well over 4,000,000 cycles.

VIDEO SIGNAL. The changing voltage which corresponds to the changing light and shade of the image being scanned at the television receiver and reproduced at the receiver.

VOICE COIL. The moving coil which is attached to the diaphragm of a dynamic loudspeaker.

VOLT. The practical unit of voltage. One volt will send a current of one ampere through a resistance of one ohm.

VOLT-OMH-MILLIAMMETER. A test instrument having provisions for measuring voltage, resistance and current. It consists essentially of a single meter having the necessary number of scales, and a switch which places the meter in the correct circuit for a particular measurement.

VOLTAGE AMPLIFICATION. Amplification which increases the voltage of a signal rather than its power. Also, a rating obtained by dividing the a.c. output voltage of an amplifier stage by the a.c. input voltage.
VOLTAGE DIVIDER. A resistor, at an intermediate point or points on which are taps that permit taking certain fractions of the overall voltage from between the taps or between the taps and the ends of the resistor. Instead of fixed taps there may be one or more movable contacts, as in a sliding resistor or are connected to it through switches.

VOLTAGE DROP. A difference in voltage due to flow of current between two points separated by resistance in conductors; equal to the current in amperes multiplied by the resistance in ohms through which the current flows.

VOLTAGE REGULATOR. A device used in a generator circuit or in connection with a generator to maintain a practically constant voltage as there are changes in speed or load.

VOLTAGE REGULATOR TUBE. A two-element tube used in a.c. radio receivers to keep the input a.c. voltage to the receiver power pack essentially constant despite wide variations in the line voltage. Also used to maintain a constant d.c. potential across a circuit.

VOLTAGE RATING OF A CONDENSER. The maximum sustained voltage which can safely be applied across the terminals of a condenser without causing breakdown of the insulation between condenser plates.

VOLTAGE TO GROUND. In an ungrounded or two-wire circuit, the greatest voltage between the specified conductor and any other conductor. In a grounded circuit, the voltage between a specified conductor and the point in the circuit that is grounded.

VOLTAMMETER. A voltmeter and an ammeter in a single case, or sometimes an instrument designed for measuring watts (volts x amperes) in a direct-current circuit.

VOLTMETER. An instrument for measuring differences of potential or voltage and indicating the differences directly in a number of volts on its scale.

VOLUME. The intensity of the sound produced by a radio loudspeaker.

VOLUME CONTROL. A device which varies the a.f. output of a receiver or p.a. amplifier, thereby changing the volume of the sound produced by the loudspeaker.

VOLUME EXPANDER. A special manually-adjusted audio circuit which can be set to increase the volume range of a radio program or phonograph record by making the weak passages weaker and the loud portions of the program louder. Volume expanders are also made as self-contained, self-powered units which can be inserted between a phonograph pick-up and the input terminals of an audio amplifier.

VOLUME UNIT. A recently developed method of expressing the power level in broadcast equipment with reference to a fixed power level of .001 watt.

WAFER SOCKET. A type of socket in which the clips for gripping the tube prongs are mounted between two wafers or sheets of insulating material.

WATERPROOF. So protected or constructed that moisture will not interfere with satisfactory operation.

WATERIGHT. So protected or constructed that water will not enter the enclosure.

WATT. The practical unit of electric power. In a direct-current circuit the expen of power is equal to the number of volts applied to the circuit multiplied by the number of amperes flowing in the circuit due to the applied voltage. In an alternating-current circuit the usable power is equal to the number of applied volts multiplied by the number of amperes of current, and multiplied by the power factor. Except in an alternating-current circuit, no appreciable inductance or capacitance, or containing only resistance, the watts of power will be less than the voltage-

WATTAGE RATING. A rating expressed as the maximum power which a device can safely absorb or handle. To determine how high a wattage rating is required for a particular resistor, multiply the value in ohms of the resistor by the square of the curent which is to flow through the resistor (resistance x current x current), and choose a resistor having a wattage rating approximately twice the computed value so as to give ample margin of safety in operation.

WATTMETER. A meter for measuring and indicating directly in watts on its scale the power being consumed in a circuit or in equipment to which the wattmeter is connected.

WAVE. Any continually varying quantity, such as an alternating current, sound wave, or radio wave.

WAVELNGTH. The distance travelled in a time of one cycle by an alternation of the sound wave or radio wave. This is the same as the distance between successive peaks having the same polarity in the wave. For wave motion in ether the wavelength in meter is equal to the number 299,792,800,000 divided by the frequency in cycles per second.

WAVE TRAP. A device sometimes connected to the aerial system of a radio receiver to reduce the strength of the signal of a carrier frequency, such as such as the frequency of a strong local station which is interfering with reception of other stations.

WEATHERPROOF. So protected or constructed that exposure to weather will not prevent it from performing satisfactorily.

WHEATSTONE BRIDGE. An instrument that allows calculation of values of resistance, inductance or capacitance in parts or circuits connected into the bridge circuit; the calculation involving one ratio of resistances which are adjustable in the bridge circuit, and another ratio in which one value is known and the other is the value of the unknown resistance, inductance or capacitance. When adjustments make the two ratios equal the bridge is said to be balanced, and the condition of balance may be indicated by a galvanometer or other current-sensitive device.

WHITE LEVELS. The range of voltages through which vary the picture signal portions of a television signal. The maximum white level is at the extreme limit of carrier modulation.

WIND CHARGER. A generator driven by a propeller mounted on or geared to its shaft. The unit must be mounted in a location where wind velocity is sufficient to rotate the propeller; this means it should be on a mast or tower extending well above surrounding trees and buildings. The generator is usually of the d.c. type and is used for charging a radio storage battery or the batteries of a 32-volt farm lighting plant.

WINDING. One or more turns of wire which make up a continuous coil. Used chiefly in coils, transformers and electromagnetic devices.

WIRE. A metallic conductor having essentially uniform thickness, used in radio chiefly to provide a path for electric currents between two points. It may be bare or covered with an insulating material such as enamel, cotton, linen or silk.

WIRED RADIO. Communication by means of radio waves or silk.

WIRELESS. Radio.

WIRELESS RECORD PLAYER. A motor-driven turntable and phono pick-up mounted in the same cabinet with r.f. oscillator. The phono pick-up converts r.f. signals into a.f. signals which modulate the r.f. carrier of the oscillator. The resulting signal is radiated through space, as a miniature broadcast signal, and can be picked up by any receiving receiver in the same house merely by tuning that receiver to the broadcast band frequency on which the wireless record player is operating.

WIRE-WOUND RESISTOR. A resistor which is constructed by winding a high-resistance wire on an insulating form. The resulting element may or may not be covered with a ceramic insulating layer.

WORK. A force multiplied by the distance through which it causes a mass or weight to move. If a force of one pound is applied to an object of one foot, the work done is equal to one foot-pound, this being one of the units in which work may be measured. Work is the result of a force acting against some form of opposition to motion. It is measured as the product of the force and the distance through which it acts.

X. A letter used in formulas to designate reactance.

XC. A symbol used for capacitive reactance in ohms.

X-CUT. A piezo-electric crystal or quartz plate cut in such a manner that
X-axis is perpendicular to its faces. Also sometimes called Currie cut and a zero-angle cut.

X-RAYS. A form of radiation which will penetrate opaque substances and affect photographic plates or films, or produce fluorescence, thus showing otherwise invisible differences in structure as lights and shadows. The rays are produced by the striking of an electron stream against a solid object called the target in an X-ray tube.

X'S. Disturbances caused by static.

Y. Symbol used for the admittance in ohms.

Y-AXIS. In a quartz crystal, a line perpendicular to the two diametrically opposite parallel faces. It lies in a plane which is at right angles to the x-axis.

Y-CUT. A piezo-electric crystal cut in such a manner that the y-axis is perpendicular to its faces. Also sometimes called a face-parallel cut or thirty-degree cut.

Z. A letter used in formulas to designate impedance.

ZERO-BEAT. A condition where two frequencies are exactly the same.

ZERO BIAS. Zero voltage between the control grid and cathode of a vacuum tube, so that these two electrodes are at the same potential.

HOW TO READ SCHEMATIC DIAGRAMS

A SCHEMATIC circuit diagram is a symbolic means of showing electrical connections in radio apparatus. It tells very little about how the various parts look, how they are constructed, or where they are located on the chassis, but it does tell how the parts ought to be connected together electrically to make the set operate. The schematic diagram also provides a quick means for checking connections during construction work and when hunting for defects in improperly operating apparatus.

A circuit diagram is read from left to right when tracing intelligence signals from the antenna to the loudspeaker. Look for the antenna or input terminals at the upper left, then move across the diagram one stage at a time. Usually the stages will be labelled to indicate their functions, so the tube lineup of a receiver can be determined almost at a glance once a bit of experience is secured with these diagrams.

The power pack is always placed near the bottom of the diagram. It can read the capacitor or replacing it by the fact that it will have an input connection to a power line or storage battery. In battery-operated equipment, the circuit will usually show
 HOW TO READ SCHEMATIC DIAGRAMS

only the terminals to which the A, B, and C batteries are to be connected.

The preliminary scanning of a complete diagram to "get your bearings" about the only time when a schematic circuit diagram need be read completely all at once. The radio man is usually interested only in one particular section of the diagram, for he works on only one section of a receiver at a time.

One important fact to realize is that junctions of wires on a schematic may be arranged differently from corresponding terminals on actual apparatus. Thus, there may be two resistors and two condensers connected to a particular tube socket terminal on the chassis, but only a single line going to that same terminal on the schematic diagram; somewhere along the line, however, you will come to the symbols for these same resistors and condensers. A schematic diagram is drawn so it will be easy to trace through, while parts are arranged on a chassis so connections will be easy to make, leads will be as short as possible, and parts which might interfere with each other are kept far apart.

The symbols used on schematic circuit diagrams to represent various radio parts are shown in the accompanying chart. When several different symbols for a particular part are in common use, these are shown. Variation in symbols are most evident in the case of radio tubes, but will give no difficulty once you learn that a dotted or zig-zag line always represents a grid, and a solid line, solid box or hollow box represents an anode.

In battery symbols, the short line is always negative or minus and the long line is positive or plus.

Several methods of showing crossovers of wires are in common use, but there should be no confusion if you first look over a new diagram to see which method is employed. If a half-circle is used to bring one wire over another when there is no connection, you can be sure that a connection is intended when wires cross without having this half-circle symbol. If there are no half-circles anywhere on the diagram at cross-over points, and there are solid dots at some cross-overs but not all, then the solid dot indicates a connection and the point where no dot indicates no connection. In any event, a solid dot at a junction will always indicate a connection.

Filament circuit connections are so standardized that a radio man seldom bothers to draw them in. Instead, he brings the two filament leads out of the tube symbol a short distance, labels one X, and labels the other Y. Corresponding filament wiring connections, and points marked Y are to be connected to the Y terminal of the filament winding. The tube filaments are then connected in parallel as is always done in a-c receivers, and almost always in battery-operated sets.

Sometimes a ground symbol will be used in place of Y, indicating that those terminals are simply connected to the nearest convenient chassis lug. Then, again, the letter H will be used on all filament leads, indicating that all tube filaments and the filament transformer are to be connected in parallel, with polarity being unimportant.

In universal a-c-d.e. receivers, the filaments are invariably connected in series. Sometimes the connections are shown in a schematic diagram, but usually the filament symbols will be omitted from the tube circles, and will be shown instead near the bottom of the diagram, all connected together as they should be. When you encounter a type of connection, be sure to follow the exact order of connections shown on the diagram. The filament of the power output tube and rectifier tube must often have particular positions in the line-up to give satisfactory operation.

Other methods of showing series filament connections are generally self-explanatory once they are studied for a few minutes while keeping the above basic facts in mind.

Connections to the chassis are usually indicated by a ground symbol. The chassis of a universal a-c-d.e. receiver is seldom connected directly to an external ground.

Bottom views of tube sockets, showing terminal connections, are usually given directly on a schematic circuit diagram or on a separate diagram. However, schematically drawn tube terminal connections are not always shown in the same rotation as the actual socket connections. In some cases, the proper terminal number is not included, a tube chart or manual must be referred to. Always use the aligning key as your guide for locating a particular terminal when working with octal-base tubes. With older tube bases, the spacings between prongs are unequal to permit locating a particular prong. In some cases the spacing is equal but the prongs are indicated by larger slots or holes. With this as a guide the other elements may be identified.
